The NCCR North-South (Research Partnerships for Mitigating Syndromes of Global Change) is one of twenty National Centres of Competence in Research established by the Swiss National Science Foundation (SNSF). It is implemented by the SNSF and co-funded by the Swiss Agency for Development and Cooperation (SDC), and the participating institutions in Switzerland. The NCCR North-South carries out disciplinary, interdisciplinary and transdisciplinary research on issues relating to sustainable development in developing and transition countries as well as in Switzerland.

# 1 Background

It is a cross-cultural and historical phenomenon that people migrate to improve their livelihoods. Due to poverty, unemployment, declining natural resources and, lately, the Maoist insurgency, labour outmigration<sup>1</sup> has become an increasingly important livelihood strategy in Nepal. According to official statistics, about 6% of the population over the age of 15 is absent from Nepal (HMG et al. 2002). Migration to neighbouring India has a long history. Migration to the Gulf and Tiger States, Europe, or the USA only commenced about 15 years ago. The choice of destination and the level of benefits and risks associated with migration vary significantly, and are dependent on economic and social resources and the status of potential migrants and their families. At the risk of over-generalizing, it can be stated that better-educated and better-skilled people with financial resources and access to information are more likely to obtain well-paid jobs in the Gulf and Tiger States, as well as in Europe and the United States, although some of them also take risks, including the risk of illegal actions. By contrast, it is the poor, illiterate, and mostly unskilled people who have very little choice and therefore migrate to India. Socio-cultural similarities and an open border have encouraged migration between the two countries for generations. Nevertheless, Nepalese migrants in India are often not able to lift themselves out of poverty (Seddon et al. 2001; Gurung 2003a, 2003b). Migration between India and Nepal is undocumented. Officially, about 589,000 Nepalese work in India, or 77% of all Nepalese migrants (HMG et al. 2002). However, Nepalese immigrant associations estimate that there are between 1.3 and 3 million Nepalese in India (Seddon et al. 2002).

Recent research carried out in two districts of Far West Nepal, where 99.6 % of the outmigrants go to India (HMG et al. 2002), confirms the national migration patterns outlined. Village case studies in the *Bājurā* and *Bajhāng* districts revealed that, due to insufficient agricultural production and limited alternative sources of income, labour migration to India in general and to Delhi in particular has been an important economic pillar for many people for generations (Müller 2001; Kollmair et al. 2003; Müller-Böker 2003).

Despite the importance of migration to India, it is remarkable how few studies exist concerning the situation of Nepalese migrants in India (Pfaff-Czarnecka 2001; Upreti 2002). Only one such study looks at the migration process from the source region and also from the perspective of the receiving country (Pfaff-Czarnecka 2001). One reason for the limited research on Nepalese migrants in India might be the common border shared by these countries and the long-standing history of Nepalese migration, so that

---

<sup>1</sup> Outmigration refers here to people who leave Nepal in search of work abroad. According to the United Nations definition, a migrant searching for work abroad is called a “migrant worker”. The present paper uses the terms “(out)migrant/(out)migration”, “labour migrant/migration“ and “migrant worker” interchangeably. References to migration within Nepal (internal migration) will be specified separately.

this migration is often not perceived as ‘foreign employment.’ The present study aims to help close this research gap.

Based on existing research about the importance of migration, questions need to be raised about how Nepalese migrants live in receiving countries, what individual or structural backgrounds enable migrants and their families to benefit from migration, and what prevents them from doing so. How do migrants manage their daily lives, how do they gain access to resources, and what are their reasons for doing so?

## 1.1 Aims of the study and research questions

The principal aim of the study is to enhance understanding of the process of migration and its contribution to the livelihoods of people from rural areas in Nepal. It also aims to help develop interventions that will maximise the benefits of migration. The central research questions are as follows:

- How do migrants in Delhi live and work and how do they obtain access to jobs and shelter?
- How do migrants access credit and savings to raise money for migration, to re-pay debts, and to save money to send home?
- How do people remit money?
- What impact does migration have on caste and gender identity?
- What kinds of social linkages exist between migrants in Delhi and their families in Nepal, and do new social linkages develop during the migration process?
- What interventions can maximize the benefits of migration?

These research questions will be addressed from a theoretical point of view and will be complemented by case studies carried out between 2002 and 2004 among migrants in Delhi from four villages in the districts of *Bājurā* and *Bajhāng*.

Four theoretical concepts were chosen as a framework for understanding these questions. The sustainable livelihoods approach shows the complexity of people’s livelihood strategies. An important component of this approach is that people adopt a range of livelihood strategies (e.g., migration) that are linked to different kinds of capital in the form of human, social, or financial capital. The assets people possess or have access to, and the strategies they adopt, are influenced by an institutional context of norms, rules, and regulations. Therefore, research on social relationships is necessary in order to explore how and why people gain access to these forms of capital and how they can use them to benefit from migration. Bourdieu’s theory of practice can be used to establish the link between the social and economic power of migrants and the outcome of migration, as well as to analyse migrants’ daily practices. Social networks play a major role in the acquisition of other forms of capital, such as financial capital. Social networks have been conceptualized within the framework of social capital, which is a third theoretical pillar. An important example of social capital in the context of this study is the operation of credit associations. By participating in these associations among kin and close friends, migrants gain access to loans and save money, and they also benefit from a certain social security in Delhi. The concept of transnational social spaces re-

flects the importance of different localities in a migration process and how families and migrants conserve existing links and create new links among themselves. Social capital is a major feature in sustaining these ties as well.

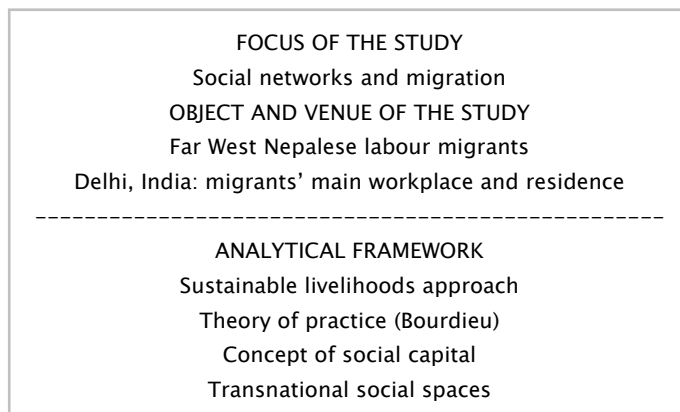

The following general assumptions underlie the present study:

- Migration is socially embedded. The longstanding history of labour migration between Nepal and India has led to transnational social networks through which contacts between families in Nepal and migrants in India can be sustained. Migrants also construct new social relations and institutions in the process of migration.
- Social networks determine, to a great extent, who migrates and where. Social networks are also the major entry point for getting jobs, finding shelter, and securing loans, and for saving money and remitting it from Delhi.
- Migration can benefit the families involved, but it can also perpetuate the debt and dependency of migrants and their families, or simply ensure basic survival rather than help to improve standards of living. One reason for this is that migrants in Delhi are marginalised because they are in relatively powerless positions. Thus they must cope with reduced opportunities in gaining access to resources to improve their well-being.

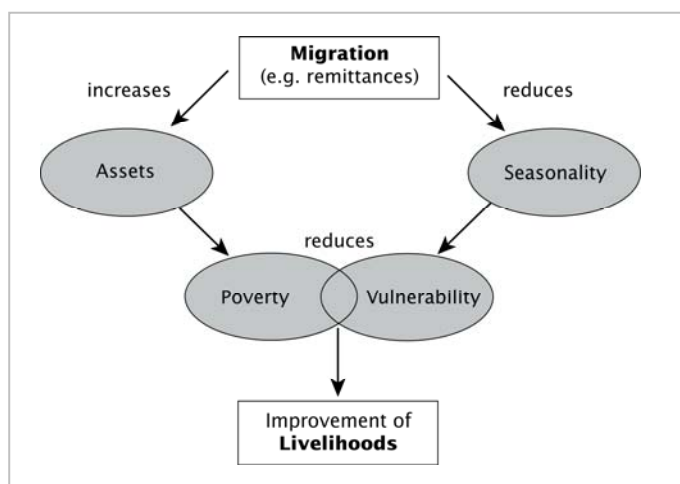

## 2 Analytical Framework

The present analysis is based on data from a case study of Far West Nepalese migrants in Delhi. In what follows, the theoretical concepts and the analytical framework of the study will be summarised and illustrated (Figure 1). Analysis and interpretation of empirical data draws on the sustainable livelihoods approach, Bourdieu's theory of practice, the concept of social capital, and the transnational social spaces approach, all of which are discussed in Thieme (2005).

**Figure 1:** Study outline

In many rural areas survival and improvement of living conditions are only possible if people do not rely on agriculture alone but adopt a range of livelihood strategies. The same applies to people from *Bājurā* and *Bajhāng* – the focus of the case study – who have a range of livelihood strategies. This complex livelihood situation integrates the sustainable livelihoods approach (Chambers and Conway 1992; de Haan and Zoomers 2005; Ellis 2003).

**Figure 2:** Remittances for improving livelihoods.

Source: Ellis 2003, adapted by Thieme 2006.

In the present study, migration is regarded as one livelihood strategy among others, such as subsistence-oriented agriculture or jobs such as tailoring or forging, depending on people's caste. People migrate at the least in order to cope with processes of impoverishment, and in the best case to increase their wellbeing and wealth (Figure 2).

According to the livelihoods approach, choice and practice in migration are closely linked with the assets people possess. A structural context of institutional rules and regulations determines access to the capital and livelihood outcomes (Figure 3). The ability to protect and enhance one's livelihood, therefore, depends not only on an asset portfolio, but also on a person's capacity to manage these assets and transform them into other necessities. Therefore, the foundation of livelihood security for individuals or households depends on access to, use of, and interaction among the various assets available (Rakodi 2002; Köberlein 2003).

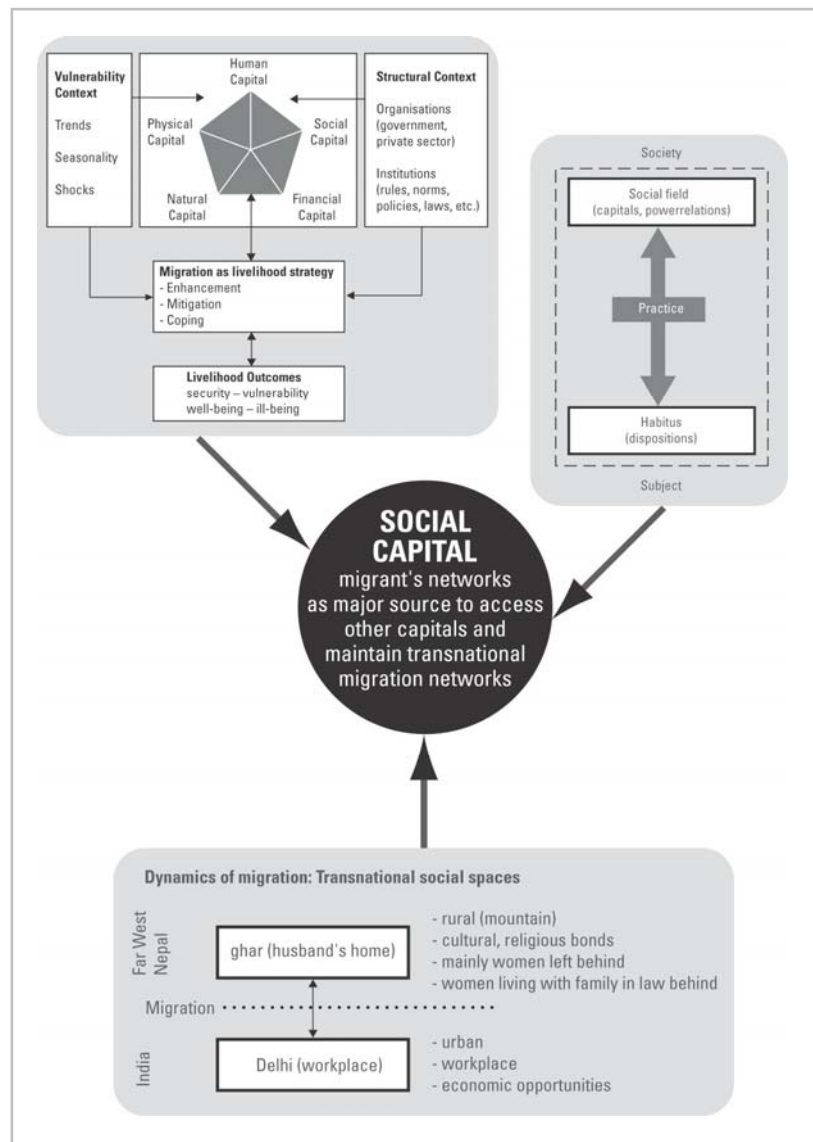

Figure 3: Analytical framework of the study.

Source: Thieme 2006.

Bourdieu's theory of practice (Harker et al. 1990; Mahar et al. 1990; Schwingel 1995; Bourdieu and Waquant 2002; Dörfler et al. 2003) has been relied upon for analysis of access to and use of resources and the relationship between subject and society and socio-economic dependencies. Social practice is a result of interrelations between habitus and social field (Figure 3). Habitus is a system of lasting dispositions and an internalised behaviour. A social field consists of the positions of actors and the relations between them, e.g. between a chairman and a 'normal' member of a credit association or between employer and employee in a job market. The relations between these positions constitute a 'social topography' in which some actors are more powerful than others. No actor's position within a social field is absolute. The position of an actor in a social field is based on possession and amounts of various kinds of capitals. Inequality of resources and access to resources are the basis of operations in each social field. They automatically favour or disfavour individuals, according to their background. Therefore, the notion of the social field is not only described by strategies but also by struggle for a position within the field.

Based on analytical differentiation of kinds of capitals by Bourdieu (1983; 1986) and DFID (2002), distinctions are made here between human, financial, natural, physical, symbolic and social capital. These are defined as follows:

**Human capital:**

- Age, education, gender, health, labour, skills

**Financial capital:**

- Credits, debts, earnings, remittances, pensions, savings

**Natural capital:**

- Common property resources such as land and water

**Physical capital:**

- Basic infrastructure such as property, rented housing, land, physical and social infrastructure, etc.

**Symbolic capital:**

- Recognition and legitimisation of other kinds of capital, such as economic or social capital, which may bring prestige and reputation.

The entire migration process, access to jobs, remittance transfers, and management of financial needs are mainly facilitated by kin and friendship networks (e.g. Portes and Sensenbrenner 1993), as confirmed by research on migration networks. These social networks among migrants in Delhi are a central part of the analysis here, and are conceptualized under the rubric of social capital (Figure 3). Whether men and women have different networks, and how they access and use them, will also be examined.

**Social capital** is defined as:

- A durable network of more or less institutionalised relationships of mutual acquaintance and recognition (Bourdieu 1986).

Four different types of social capital can be linked to specific social processes (Portes and Sensenbrenner 1993; Portes 1998):

- Value introjections
- Reciprocity exchanges
- Bounded solidarity
- Enforceable trust

Three additional connecting strands of social capital are:

**Bonding social capital:**

- Close and firm ties among family members, kin and friends; social support such as emotional and physical support

**Bridging social capital:**

- Less dense ties; more cross-cutting ties such as business associates or close acquaintances

**Linking social capital:**

- Influential social ties between people with different power and social status, such as links between underprivileged persons and political authorities (Woolcock 2003; Thieme 2006).

These sub-categories of social capital also imply that possessing social capital not only advances but also constrains individual action, such that outsiders are excluded or individual freedom is restricted in favour of the group. The amount of social capital available to individuals depends on the extent of the network of social ties that can be mobilised and the amount of other kinds of capitals, such as financial and human capital, that members of networks can muster. Social capital is created and accumulated in social relations, but can be used by individuals as a resource. Social capital is not a community asset, assuming the existence of a homogenous community with common interests and shared values. Rather, power is distributed unequally and inequality may be reproduced (Bourdieu 1986).

The key characteristic of capital is that it can be converted from one form to another, not automatically, but through transformation work (Bourdieu 1983, 1986). The major example in the present study is how migrants mobilise social capital to form credit associations that provide them with access to financial capital. Looking at who has access to which networks and how they operate and why, it becomes obvious that other forms of capital have to be taken into account also. In all cases, however, migrants only receive a value for capital if they enter a social field where it is valued. For example, close kin or friends who work in the same sector (bonding social capital) might be helpful in providing emotional support for finding a job, and in the best case may be able to arrange for a job similar to their own that provides an income (economic capital). However, bonding social capital of this type may only be useful in a limited way in finding a higher-skilled and better-paid job.

In making use of social capital and the theory of practice, migrants do not theoretically receive preferential treatment. Their situation is analysed by means of the same concepts as the situations of all other members of society. Therefore, drawing on the concepts of ethnic niche or ethnic economy (Light and Karageorgis 1994; Portes 1994) to explain why migrants work in a specific labour market sector and how they manage their economic life becomes obsolete. For example, the 'ethnic' character of occupying a specific job niche is then a result of the relation of specific kinds of capitals and the interplay of social fields and habitus. The overlap between culture and economy is no longer automatically classified either as anachronism ('tradition') or crisis management ('regeneration'). Culture does not create differences per se, but it is possible to look at the different components of the 'ethnicity' of each society or economy. Differences are then not a premise but a result of analysis (Portes and Jensen 1992; Timm 2000; Diener 2002; Herzig and Richter 2004: 47-49).

However, to grasp the dynamics of migration and provide a further dimension for analysing the everyday networks and patterns of social relationships that emerge through migration, we shall introduce the concept of transnational migration and social spaces (Portes 1999; Vertovec 1999; Pries 2001). This indicates a shift in the perception of the relation between social and geographic space. This concept does not solely apply in either the country of origin or in destination countries, but includes both. Migrants are not uprooted but rather move back and forth across (international) borders. Social, cultural, political and economic conditions in countries of origin and destination regions are interconnected, showing the cross-border and international character of livelihoods. This suggests that even more permanent settlement in the country of destination does not necessarily imply a complete rupture of social ties and other forms of linkages.

Space is not only a physical feature but also consists of larger opportunity structures, social life, values, and meanings that a specific and limited place represents to migrants. When people migrate from one place to another they leave the context they are familiar with. They find a different locale or space with a different framework of interaction in the country of destination. Crossing a border and being in a different country is only one component of transnational migration and social spaces. Migrants also have to cope with a great contrast between rural home villages and urban Delhi. For example, in the rural settings that are home to villagers from Far West Nepal, people live in an agricultural community with strict caste rules and patronclient dependencies, and limited access to transport, communication, health, and education infrastructure. Such infrastructure exists in Delhi, but access to it is expensive and can only be paid for if migrants find a job or if they know how to use the infrastructure. Depending on the interaction between migrants and people who remain in their home villages, migration can lead to the transformation of the everyday lives of migrants, as well as transformation for their families who remain in Nepal. Social capital is a major feature in sustaining transnational social spaces.

## 3 Methodology

### 3.1 Data base and research framework

The original plan of the present study was to go to the migrants' villages of origin in Far West Nepal and then follow them to Delhi. However, due to political insecurity in Nepal the plan could not be implemented, and the study outline had to be adapted. Therefore, the results of the study are based on the author's research in Delhi and data from a previous research project entitled 'Nature and Society,' carried out by the Development Study Group at the Department of Geography, University of Zurich, between 1999 and 2001 in Far West Nepal. The aim of this project was to analyse the living conditions and livelihood strategies of the people in the buffer zone of the *Khaptad* National Park in Far West Nepal and the impact of the national park on people's livelihoods (Müller 2001; Kollmair 2003; Müller-Böker 2003).

One major insight from the surveys in Far West Nepal was that migration of labour to Delhi is a main source of income. As a consequence, the question of organization of the migration process and its impact on people's livelihoods arose. For this purpose, migrants in Delhi had to be studied in detail. Research was carried out from 2001 to 2005 to address these issues.

### 3.2 Research situation in Delhi

The success of research in the field depends greatly on what role the researcher is perceived as playing, and how well he or she is integrated and accepted (Müller-Böker 1999: 18-19). The major points that influenced perception of the author's role as a researcher were the unsettled political situation in Nepal and work with a Nepalese research assistant. Both situations will be elaborated upon in more detail in the following sections.

#### 3.2.1 Impact of the political situation in Nepal on research in Delhi

The political situation in Nepal not only affected plans to carry out research in Far West Nepal, but also influenced research conditions in Delhi.

Since 1996, the Communist Party of Nepal-Maoist (CPN-Maoist) has been waging a civil war to establish a communist republic in place of the existing constitutional monarchy. In recent years this conflict has evolved into the most serious internal crisis since the founding of Nepal in the mid-18th century; there are no signs that the fighting will end in the near future (Thapa 2002). Thousands of people have been subjected to raids and arrested on mere suspicion of being Maoists or Maoist sympathisers who aided Maoists in carrying out raids or simply provided food and shelter when their villages were occupied. People described the political situation as arbitrary and hopeless; they are caught on the front lines between the state army or police and the Maoists. Even

people who do not sympathize with any party fear retribution from the Maoists; this prevents them from taking any action that appears to help the police. The police in turn see the lack of active support for them as tacit support for the Maoists (Mikesell 2001; Verma 2001; Thapa 2002; Haubold 2003; Krämer 2003).

According to immigrant associations, migration has been intensifying since the outbreak of this civil war. All migrants felt safer in Delhi, where they at least had the chance to earn a salary. Many reported that they and their families were humiliated and abused. Whenever possible, men seized the opportunity to go to Delhi or other Indian cities, depending on where they had relatives. Some migrants moved family members to the *Terāi* (lowland of Nepal) in cases where they had land there. However, the majority of women and children remained in villages in Far West Nepal. Male migrants felt financially unable to support families in Delhi. Consequently, they were very much concerned about their family members back home.

Many migrants face stigmatisation and psychological as well as physical humiliation in Delhi from employees, neighbours, or the police. In addition, they now face political suspicion in Delhi. The Indian government is concerned that the Nepalese in India may be linked with the Maoist movement and be financing it by sending remittances from India. Therefore, crossing the border also became complicated. In this political context, it took time to build trust among migrants. Many informants were far less interested in the formal design and goals of the research than in the person and character of the author. They wanted to know how the research might influence their own lives (see also Scheyvens et al. 2003). The first worry of the migrants was that the author, and especially her Nepalese interpreter, might provide information to the 'government'. Aside from the political difficulties, they generally queried why somebody was interested in their 'daily, unspectacular' life. The author identified her role as an objective researcher hoping to make a scientific contribution. It was also mentioned that research offered the possibility to support positive change for the migrants, and was implemented in cooperation with an NGO in Delhi (Thieme et al. 2005).

### 3.2.2 Working with a research assistant

The author overcame the obstacle of limited Nepali language skills by working with a research assistant. Hiring a research assistant was a difficult task. A male Nepali was required, preferably from Far West Nepal, living in Delhi at the time, fluent in Nepali and English and preferably also in the local dialects of *Bajhāng* and *Bājūrā*. A male was preferred because most of the migrants were male. He also had to be someone interested in the topic and willing to work according to the tight and lengthy time schedule of watchmen and female domestic workers. He also had to travel across Delhi every day for about two hours, because the migrants are spread all over the city. Ideally, this assistant should be somebody with some prior knowledge of immigrants in Delhi, or even access to them. After a meeting the representative of the Migrant Nepalese Association India (MINA), it turned out that his son, Deepak Prakash Bhatt, was interested in the work and subsequently became the author's research assistant. He comes from Mahendranagar, Far Western Development Region, and is a PhD candidate in

Delhi. He is fluent in Nepali, Hindi, and English and also has some knowledge of local dialects. Additionally, he is active in an immigrant association. He was an enormous asset during fieldwork, eased access to participants, and facilitated acceptance in the community. He worked with the author during all her visits to Delhi between 2002 and 2004.

### 3.3 Access to the field and methods

#### 3.3.1 Access to migrants in Delhi

The research site for the current study was Delhi, India – the main destination for migrants from the villages of *Singrā*, *Serāgāū*, *Gothpādā* and *Meltaḍī* located in the Far Western Development Region of Nepal (Figure 4).

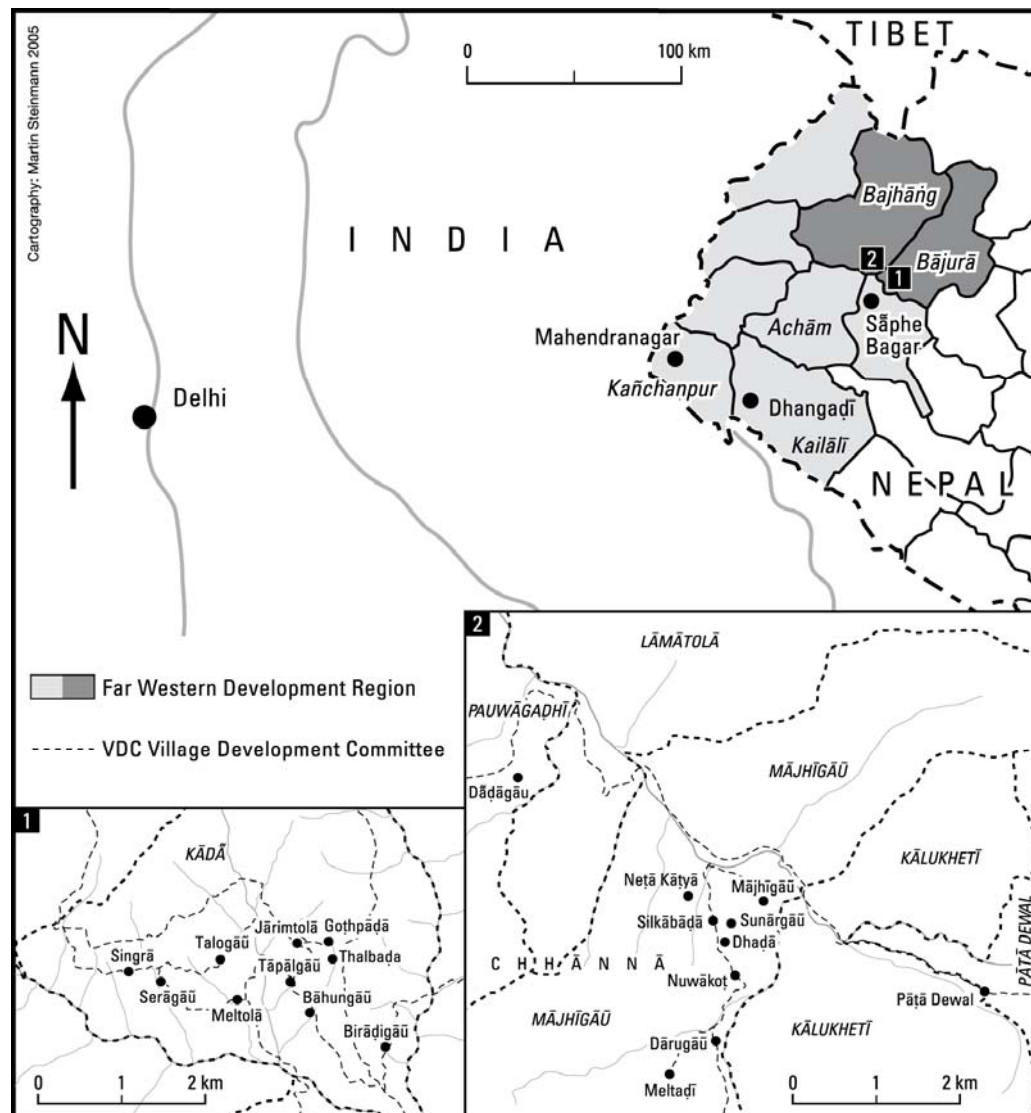

Figure 4: Map of villages in *Bājurā*, *Bajhāng* and Delhi

In March 2002, the author went with members of the Zurich Development Study Group to Nepal to coordinate research with Nepalese cooperation partners in the NCCR North-South programme, and to identify the possibilities of finding migrants from Far West Nepal in Delhi. However, as it was impossible to go to *Bajhāng* or *Bājurā* for security reasons, the group went directly to Delhi.

For the first few days in Delhi, our Nepalese research partner (Ganesh Gurung, Nepal Institute for Development Studies, NIDS) supported the author in initiating research activities and finding an interpreter. We knew that the migrants lived and worked in Delhi, but we had no contact addresses there except for one phone number. During the fieldwork in 2000, one colleague in the Development Study Group (M. Kollmair) was told by a villager from *Gothpādā* that many of his co-villagers were in Delhi. He provided a phone number of one of the migrants in Delhi (Kollmair field notes 2000). When we tried to call him, one year later in March 2001, nobody was willing to provide us with information. Still, we decided to keep on trying. On our third day in Delhi, it became apparent that the number belonged to an accounting office that employed a villager from *Gothpādā* as a peon. One day later we met this person and he kindly invited the author to a meeting of his financial self-help group, where she was later to meet about 35 villagers from *Gothpādā*. The author knew that villagers from *Gothpādā* had close contacts with villagers from *Singrā* and *Serāgāū*. However, in the beginning they were not willing to provide contact information.

At the same time, we also visited the Nepalese Embassy in Delhi to ask for information about how to contact Nepalese immigrant associations. However, none of these associations had personal contact information for people from *Bājurā* or *Bajhāng* districts. They explained that it was because people from the Far West are not organized in Delhi. During the first week in Delhi, the author and her interpreter drove virtually the whole day through Delhi following up on hints from migrants about where to locate people from the villages of *Singrā*, *Serāgāū* and *Meltaḍī*, or at least from the districts of *Bājurā* or *Bajhāng*. However, during the first visit to Delhi, we were unsuccessful and were left for the time being with information from *Gothpādā*, interviews with migrants from other villages, and representatives from immigrant associations.

In August 2002 the author returned to Delhi for a second visit. At this time the political situation was even more unsettled in Nepal and was also influencing the lives of Nepalese migrants in Delhi. The villagers from *Gothpādā*, after a second meeting on this occasion, provided information that enabled the author to contact migrants from *Singrā* and *Serāgāū*. Finding migrants from *Meltaḍī* still seemed difficult, because none of the migrants we had met thus far knew anything about them or anybody from the neighbouring villages. Therefore, we continued to explore their networks and enquire of immigrant associations, the migrants we had met so far, and the watchmen working in different quarters (knowing that many of the migrants we were seeking worked as watchmen). Finally, the author's interpreter found a person from the neighbouring district of *Achām* who knew people who were supposed to know people from *Meltaḍī*, *Mājhīgāū* VDC. This group of ten people came from the neighbouring VDC of *Pāṭā*

*Dewal*. They belonged to the *Damāi* caste. According to them, 35 people from their village and caste were in Delhi. Their economic and political situation in Nepal forced them to work in Delhi. Maoists had occupied their village, and they were forced to provide them with food and shelter. Maoists had beaten up two of them. Some days later the police came to their village. They accused them of having harboured Maoists and making clothes for them. A policeman beat up one of the informants. These experiences typify the arbitrary situation of people who are caught between the Maoists and the army or police. This was the main reason why they refused to provide us with any information about their colleagues from *Meltaḍī*. However, they agreed to do so at a second meeting the next day, at which we gave them more background details about our research. Finally, they provided us with the address of a person from *Meltaḍī* who became in the course of time one of our main informants in Delhi.

### 3.3.2 Methods used for data collection and analysis

From 2002 until 2004, the migrants from the four villages were interviewed during four field visits totalling 4.5 months. Additionally, four weeks were spent in Kathmandu doing research on the literature and expert interviews. The study concentrates on migrants from the four villages of *Singrā*, *Serāgāū*, *Gothpādā* and *Meltaḍī*. As the target of the study was to explore the social networks of migrants, other people who had a stake in the migrants' lives, also had to be included. The following methods were used:

- expert interviews
- quantitative survey
- indepth interviews with male and female migrants
- group discussions among migrants
- participatory observation of financial self-help groups
- analysis of account books of financial self-help groups

Expert interviews were held with representatives of international organizations, local NGOs, and immigrant associations about general issues related to migration. One representative of an Indian bank and the head of a commercial rotating credit association company were interviewed in order to get more background on savings and loan options in India, and specifically in Delhi.

The quantitative survey was carried out in Delhi among 128 migrants, mainly from the villages of *Singrā*, *Serāgāū*, *Gothpādā* and *Meltaḍī*. It was designed in cooperation with the South Asia Study Center (SASC), and carried out by SASC in 2004. The questionnaire covered topics such as origin, work, shelter, remittances, loans, and health.

In carrying out interviews, group discussions, and observation among the migrants, meetings of financial self-help groups were an important entry point. For many migrants, these groups are an important facility for managing savings and loans.

Additionally, snowball sampling was used to gain access to labour migrants (Scheyvens and Storey 2003). Having found persons from the respective villages, the author enquired if they knew of others. Again, new people would be asked for more names

until it was clear that no further information was available (Scheyvens and Storey 2003). Bertaux (1981a, 1981b) calls this the 'point of saturation of knowledge'. At this point the information received is relevant to and sufficient for the problem of interest, and no new information is likely to come up in the form of controversies or things hitherto unknown (Bertaux 1981a, 1981b; Agozino 2000).

Reflecting on the interviews in Delhi leads to agreement with Agozino (2000), who describes the process of data collection as more a process of 'data reception.' Informants are autonomous subjects, and they decide what information they will provide. In interacting with migrants, the author never insisted on talks irrespective of the consequences for the interviewees involved. However, there was always a risk that informants would exaggerate the nature of the problem, because they might have an interest of their own, for example, benefiting from the research. Attempts were made to preclude exaggeration by asking what problems they had been dealing with rather than what their attitudes towards the problems or institutions were (Agozino 2000). There was always a risk of being over-selective and excluding important information from migrants, whether intentionally or unintentionally. One way of avoiding this exclusion was methodological and data triangulation, in which information from observation, the quantitative survey, interviews, and discussions with migrants, immigrant associations, NGOs and international organizations was collected (Flick 2000).

### **Conducting interviews**

Because the author never had a 'one-to-one' interview situation, the interview setting is described more closely here. As mentioned above, financial self-help groups were an important entry point for finding interviewees. These groups always meet at the beginning of the month at the same time and in the same place. Between 30 and 150 members participate. Most of the meetings take place in public parks; some are held in living rooms. Meetings attended during the research period lasted about half a day. Thirteen financial self-help groups were visited in Delhi. Six of the groups were visited two or three times during 2002 and 2003. During discussion of financial matters, we were often allowed to sit with the members and observe the meeting. Members would explain what was being discussed. After financial matters were concluded (and sometimes before), people would often split up into smaller groups and chat. On these occasions, research questions would be discussed with them. Sometimes one or two persons took the lead in talking; in other situations vital group discussions evolved and unanimous as well as diverse opinions were given. As a result, many people agreed to our visiting them again at their lodgings. Because of their congested living conditions, interviewees were often not alone; roommates or neighbours might also be present. Another problem was that as many men had night and early morning duties as watchmen and car cleaners, they slept for part of the day.

Because of the patrilineal and patrilocal society in Far West Nepal, conducting interviews with women was not an easy task, either in the village or in the city. Research in Far West Nepal had already shown that women walked away when they were asked questions or simply did not answer, deferring to their husbands. But later on, having

been without male family members for some time, they became very talkative, often lamenting about their hard life (Thieme and Müller-Böker 2004, Thieme et al. Forthcoming). The interviews in Delhi were also difficult to conduct. The fact of having only a male interpreter, the very tight time schedules of the women, and lack of space and privacy in the congested living spaces were particular problems. Men were usually present and very sceptical. Only after several visits and discussions did they allow their wives to participate. Therefore, only three interviews were held with women alone.

A general challenge during field research was to find out where the migrants lived and to locate them again during the next visit to Delhi, because they often moved. In Delhi, it was difficult to keep to the interview schedule arranged. Migrants lived in different, scattered quarters, and heavy traffic congestion often meant it took up to an hour to travel a mere 3 km.

Summarizing the interviews with migrants, a total of about 500 were encountered as a result of the large number of participants in financial self-help groups. The author attended 21 credit association meetings, including various group discussions during these meetings. A total of 98 migrants (91 men and 7 women) were approached again directly in their lodgings. Many were visited two or three times in the course of the two years to follow up on their stories and see if they still had the same job and lodgings.

All interviews were carried out with the author's interpreter, Deepak Prakash Bhatt. The interviews were not taped. During the translation, information was always written down. After each interview or group meeting, respectively, we summarised and discussed the notes. Minutes of each financial self-help group meeting were taken. These meetings were often a combination of observation and group discussions. It was possible to make copies of the accounts of two financial self-help groups, in order to follow the history of these groups since their establishment.

### **Data analysis**

Analysis of the semi-structured interviews was carried out according to Schmidt's (2000) description of analysing interviews. Based on the interviews, categories were developed as the first step. In the second step, these were put together in a guideline. Thirdly, all interviews were coded by following the guideline. Based on this codification, an overview of case studies was compiled. In the fifth step, the overview formed the basis for choosing individual, in-depth case studies (Schmidt 2000). In order to assess the frequency of certain courses of action, such as jobs and remittances, these activities were counted.

The minutes of the financial self-help groups were also coded according to a guideline. Additionally, the accounts of two financial self-help groups were analysed. Members permitted the author to photocopy them, which made it possible to examine the written rules and regulations for the financial self-help groups, membership, and monthly auditing. These were compared with the rules that were practised while the author observed group meetings. The quantitative survey was analysed using Excel (SASC 2004).

## 4 Places of Origin in Far West Nepal

The four villages are situated in the *Bajhāng* and *Bājurā* districts, in the centre of the Far Western Development Region. This area is extremely impoverished even by Nepalese standards, and the region has the lowest Human Development and Gender Development Index within Nepal (NESAC 1998; UNDP, 2002). For example, in *Bājurā* only 6% of the women above 25 are literate, while 42% of the men above 25 can read and write (NESAC 1998:269). This situation is not likely to improve because 104 boys as against 18 girls were registered in grades 1 to 5 in the villages of *Singrā* and *Serāgāū* (Müller 2001).

Moreover, the region is marginalized and isolated from mainstream development, far away from major centres of innovation and services, and national and international politics. In addition, the development of the area has been affected by the armed conflict between the Nepalese Maoist movement and Nepalese government.

**Table 1:** Caste system in Far West Nepal in migrants' four villages of origin

	<i>Jāt</i>	<i>Thar</i>	Occupation
Pure/clean caste ( <i>chokho jāt</i> )	<i>Bāhun</i>	<i>Upādhyāya, Jhosi, Bhatta, Pandey</i>	<i>Pujāri, Pandit</i> (Priest)

	<i>Kāmi</i>	<i>Kāmi, Sunār, Luhār, Āgrī</i>	Blacksmiths and goldsmiths
		<i>Okheḍā</i>	Guards
		<i>Chaḍākā or Chandārā</i>	Woodworkers
	<i>Damāi</i>	<i>Dholī, Damāi, Daude, Dās</i>	Tailors
<i>Bādi</i>	<i>Bādi</i>	Singers, dancers	

Source: Kollmair/Müller-Böker/Manandhar: survey 1999/2000; Bista 1999:43, adapted by Thieme, 2004.

Unlike the caste system in India, the hierarchy of *jāt* (caste) in Nepal is far from being perceived as universal. Different groups and individuals interpret the hierarchy of *jāt* in various ways. The model proposed by Bista (1999) is used here, where "ritually pure" *jāt* is separated from "impure". The majority of the population covered by this study belongs to the "pure" high Hindu castes, which are distinctly separate from the "impure" castes (Cameron 1998; Müller-Böker 2003; Thieme 2006). People from *Singrā*,

*Serāgāū* and *Gothpādā* belong to the *Chetri jāt*. They are based in the same VDC where people from the *Bāhun*, *Thakurī*, *Kāmi* and *Sārki jāt* also have their hamlets. Since *Meltaḍī* has different hamlets, the people are *Bāhun*, *Thakurī*, *Chetri*, *Sārki*, *Kāmi*, *Damāi* and *Bādi* (Table 1). These local institutions are responsible for great social disparities, as they determine people's livelihood strategies and govern relationships.

The clan structures, known as *thar* (patrilinear family), are very complex. Furthermore, the daily life of the communities is governed by many strict rules of interaction, which are more stringently practised than in other parts of Nepal. Caste affiliation determines social and economic practices and livelihood strategies. For example, ploughing is of no benefit to *Bāhun* and *Thakurī*. Forging iron and gold, leather processing, prostitution, tailoring, and the playing of certain musical instruments are activities evaluated as ritually "impure." Thus, only "impure" castes should engage in them. Members of the lower castes are not allowed to touch upper-caste people, or even use the same water source ("water unacceptable" *jāt*). *Jāt* rules also govern marriage. For example, among the *Chetri*, *Khaḍkās* can marry *Thāpā*, *Rokāyā*, *Kārki*, *Bistā* and *Chuwān*, but not *Rāwal*, as they believe they are from the same generation. They also do not marry *Saud*, as they believe they are lower than *Khaḍkā*. People from the villages of *Singrā*, *Serāgāū* and *Gothpādā* belong to the *Rāwal* and *Rokāyā* clans. Marriages are mainly between the two clans. The search for a bride is mainly within these or surrounding villages, and, in rare cases, also in the neighbouring district of *Achām* (Müller 2001; Müller-Böker 2003).

The most important relationship between high-caste and low-caste households is the traditional patron-client system, which has been in existence for generations. Low-occupation castes such as *Damāi* or *Kāmi* provide sewing and forging services to high-caste people in exchange for grain.

## 5 Discussion of Results

To begin with, the migration framework and the transnational social spaces between the home region in Nepal and the receiving region in India are characterised (5.1). This addresses the research question concerning the social linkages that exist between migrants in Delhi and their families in Nepal, and whether new social linkages develop during the migration process. This section is followed by a discussion of the capital endowments of migrants and how human, financial, and social capital are created, accumulated, mobilised, and transformed. Chapter 5.2 deals in particular with the question of how migrants in Delhi live and work and how they gain access to jobs, shelter, credit, savings, and opportunities to remit their earnings back home. The major focus of the current study is social capital as an entry point for the creation of other capital, demonstrated by the operation of financial self-help groups and the existence of ‘job-chains’ among migrants. The opportunities and risks of these financial self-help groups are discussed, showing to what extent they contribute to successful creation of financial capital (5.2.1) and what role social capital plays in the working and living conditions of migrants in Delhi (5.2.2). The chapter concludes by addressing the question of the impact migration has on people’s livelihoods and their caste and gender identity, taking both positive and negative outcomes into consideration (5.3).

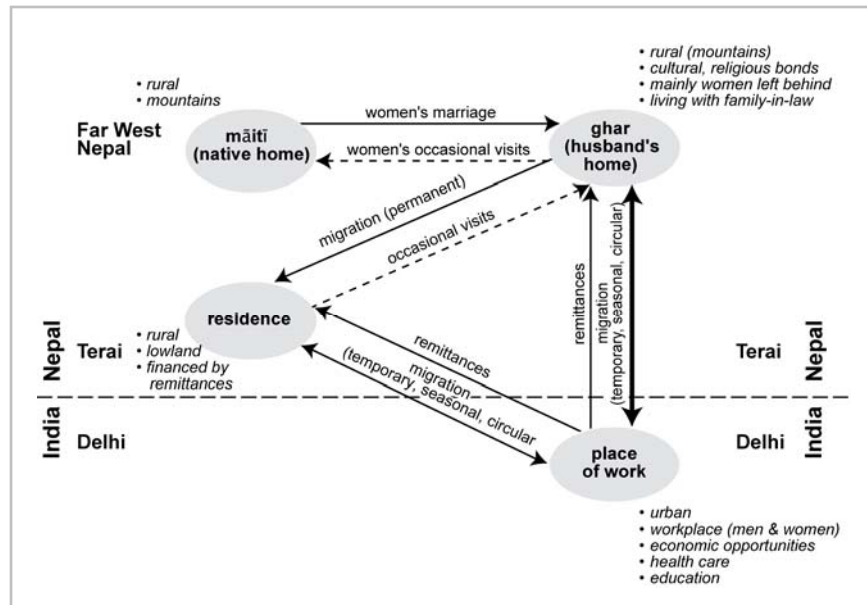

### 5.1 The migration framework and plurilocality of migrants

Labour migration to Delhi is a major livelihood strategy for many people from Far West Nepal. Economic hardship caused by food deficits in the region, unemployment, and debt are the main reasons for migrating. Social discrimination, political instability in Nepal, medical treatment, and sometimes the education of children were other reasons given for migrating by the migrants in Delhi. For many people, either as migrants or as family members who remain behind, migration is not an exception but rather a routine and integral part of their lives that has been practised for generations.

At present there is no single, coherent theory explaining the initiation of migration. Several approaches support the finding that people migrate not only to maximise expected income, but also to minimise risk and lessen constraints such as seasonality, political instability, and lack of financial capital (Stark and Bloom 1985; Stark 1991; DFID 2002). However, given the fact that migration theories conceptualise causal processes at different levels, it is likely that individuals act to maximize income whereas families act to minimize risks, and the context within which both decisions are made is shaped by structural forces operating at the national and international levels (Massey et al. 1993). To migrate is not an individual decision, but rather the strategy of a larger unit of people, mainly families or households (Stark 1991; Chant and Radcliffe 1992; Curran and Saguy 2001; Ellis 2003; Herzig 2004). In Far West Nepal, it is mainly men who migrate. Regardless of whether they migrate seasonally or spend most of the year in Delhi, the majority of migrants have families in Nepal. The reasons for gender selectivity in migration patterns lie in the patriarchal culture manifested in intra-household

resource and decision-making structures and other cultural values. The socially-determined and gender-segregated labour market in India and Nepal is an additional aspect (Chant and Radcliffe 1992). Women bear the main responsibility for housekeeping and child-rearing and are involved in agricultural work. The man is the main cash-income earner and migrates for work. Women only migrate within the context of family or marriage, or follow their husbands to Delhi for medical treatment. However, it is important to recognise that the number of women migrating on their own is increasing in Nepal (Sancharika Samuha and UNIFEM 2003) and internationally (UN 2002).

The division of labour and the long history of migration led to the emergence of 'transnational social spaces' (Pries 1999, 2001). Migration affects migrants as well as the people who remain in the villages. It structures the everyday practices, social positions, employment trajectories, and biographies of women as well as men, who exist above and beyond the social contexts of national societies (Pries 2001: 65) although they are not independent from them. The household is not a residential unit but rather a tight network of exchanges of support, pooling goods and services that spans between Far West Nepal and Delhi, sometimes even extending beyond to other places (Figure 5; Thieme et al., forthcoming), and this leads to a plurilocality of migrants' and family members' lives. In addition to Delhi, women already have another locale, because they have already migrated from the natal (*māitī*) to the husband's home (*ghar*). However, their main point of reference for most of their lives is their husband's home (*ghar*). Migrants have strong emotional attachments to their home villages in social, cultural, and religious terms. The foreign context (Delhi) conveys material bounty and economic opportunity. Yet, they feel forced to go to Delhi and do not feel 'at home' in Delhi. All migrants dream of going back to Nepal and never having to return to India. The return to Nepal does not necessarily have to be to the home village in Far West Nepal. Many dream of earning enough money to purchase land for the family in the *Terāi* (lowland of Nepal). However, in reality, the majority of migrants do not have the financial capital to invest in such land. Therefore, Delhi and their home villages remain the major migration link within the conceptualized plurilocal social spaces. If people can afford to buy land, they do so step-by-step, and some of the family live in the *Terāi* and some in Delhi, while others still live in the home village, and the *Terāi* as another locale or encultured space slowly develops (Figure 5).

**Figure 5:** Plurilocality of migrants and non-migrating family members

Source: Thieme et al. Forthcoming

This multi- or plurilocality of ‘the home’ is also described by Subedi (1993) for Nepalese who migrate to find work. It includes migrants who circulate frequently as well as people who have established a new household in another locality, which Subedi (1993) calls ‘reach’, and show very little inclination to return. However they still do not abandon the option to return, especially if they have land at home.

Based on Conway (2005) and Vertovec (2003), it can be assumed that the life spaces in which migrants and non-migrating family members live are influenced by social identities and structures from ‘home’ as much as by the global or urban-metropolitan structures of Delhi or structures in other locales. This transforms the meaning of ‘home’. These structures are replicated or transformed; being at a different ‘place’ also creates new ‘spaces’ (Pries 1999; Vertovec 2001). Although not part of the study, the plurilocality of migrants’ lives and the interlinkages of international and internal migration circuits have to be taken into account in the theoretical discussion about transnational social spaces (Conway, 2005). The current study shows that, for migrants, moving from one country to another is only one dimension of creating new social spaces. Because of the cultural similarities between Nepal and India, it can even be argued that the change from the rural to the urban context has the same or even a greater influence than a change of countries. The majority of migrants have never been to a big city other than Delhi. This suggests that people would have to deal with as much difference in Kathmandu as in Delhi, shifting from geographically marginalised (Gurung and Kollmair 2005) villages to a place with access to physical and social infrastructure. Therefore, although the transnational social space that can emerge as a consequence of migration connects different spaces, the spaces provide largely different contexts for migrants. The uncertainties connected with this change can produce anxiety. Moreover, these spaces are not fixed entities. They also change rapidly due to globalisation. Globalisa-

tion is another factor migrants have to cope with and it can produce anxiety, or at least uncertainty (McDowell 1996), and also paralyze migrants in terms of improving their lives.

However, the ambivalence and the negotiations surrounding these different locales are expressed in a variety of ways, including the exchange of goods, images, and ideas between the different settings (Gardner 1993). Social capital is the main precondition for sustaining these transnational or multilocal linkages. Male and female migrants rely on social networks to establish themselves in Delhi, to find a job and accommodations, to gain access to savings and loan opportunities, and to remit money. Therefore migrants prefer to go to the same destination always, as was confirmed by another study of migrants in Bangalore (Pfaff-Czarnecka 2001). The permanent coming and going of migrants in Delhi is the major precondition for the transferral of news, remittances, and goods, because of geographical marginality and, e.g., lack of banking and telecommunication infrastructure in Far West Nepal. If the family stays in Delhi, the remittances might be less, but the 'circuits of transnational obligations and interests' (Vertovec 2003: 16) for financial and organizational support if new kin arrive remain.

## 5.2 The capital endowment of labour migrants from Far West Nepal in Delhi

The social practices of migrants in Delhi not only arise from the fact that they are migrants, but are also a result of the interplay of the different kinds of capital they possess, the social fields they are engaged in, and their habitus. In general, migrants in the present study possess little financial, social, and human capital. Regarding human capital, many migrants have little formal education, and can neither read nor write. Although Hindi and Nepali originate from the same script, the women especially do not understand Hindi. The general knowledge and abilities of migrants, which are important in the rural context in Nepal, are not valued in new social fields in the urban and foreign context of Delhi. For example, agricultural knowledge is not important for survival in the city. Migrants need to know how to maintain security in an urban environment; women have to know how to run a middle class Indian household, and the tailor highlighted how important it is to know how to tailor fashionable clothes. Therefore, social capital is essential to ease the lack of other capital and to sustain life in Delhi. However, the majority of migrants only possess bonding social capital, which primarily provides social support but does not generate a more diverse flow of and access to the human, financial, and symbolic capital needed to advance interests and aspirations. This bonding social capital of family networks is of greatest importance in terms of coping mechanisms. When family networks are insufficient or unable to respond, assistance is sought in kinship or caste networks, and sometimes even beyond caste. These social categories provide people with stability. Within these networks, solidarity and trust can be seen as a contractual arrangement and as an entry ticket to a job, as well as to savings and credit associations. These arrangements are not formed by official contracting, but rather by a sense of knowing the strategies in the field of a credit association or 'job-chains' (Bourdieu and Wacquant 1992; Reinke 1998). Solidarity, as part of social capital, does not simply exist. It is an input into a production process in which access to

economic capital is jointly produced through social capital (also Reinke 1998: 556). Group members accept obligations for the economic as well as the social functions of the group.

### 5.2.1 Savings and credit associations

For many migrants, financial self-help associations are a focal point in their lives, and are a prime example of how migrants mobilise social capital to access financial capital (Thieme 2003; Thieme and Müller-Böker 2004; Thieme 2006). We shall therefore examine here the extent to which these associations support or hamper migrants in managing their incomes and increasing the amount of remittances they send to their families. For a long time, landlords, or any people with a regular income, were the main source for money-lending. Although migration has been practised for generations, financial savings and credit associations are a recent phenomenon among the migrants interviewed in Delhi. Migrants formed them to manage their loans and savings according to their own needs and to avoid usury by private money-lenders. Savings and credit associations are an example of the concept of social capital whereby enforceable trust is essential for their successful operation. Rules, such as membership criteria, monitoring, and sanctioning procedures, are officially institutionalized when the association starts because members agree on them (Krishna 2000). However, within the timeline of a credit association only practice will show whether these rules really are institutionalised, or whether they are circumvented from time to time. Debt and finance cycles for migrants are very complex. As Shipton (1992) states, since credit has connotations of confidence and trust, it is only a nicer way of saying debt. And since there is no credit without debt, there is none without patronage. In becoming a member of a credit association, an individual gains credit-worthiness but takes on contractual obligations at the same time. These obligations not only define the roles of group members and their chance to benefit, but also the weaknesses they have to deal with. These are summarised in the following sections.

#### Operation of savings and credit associations

The two main financial self-help associations prevalent among the migrants are *ciṭs* and *sosāiṭīs*. Table 2 summarizes the basic principles of a *ciṭ* and a *sosāiṭī*. Both kinds of association are set up by the migrants. They are voluntary, autonomous, and membership-based organizations. They have their own objectives, rules, and organizational patterns to which all members agree. They are independent from the legal, fiscal, and financial authorities of India and Nepal (also Bouman 1995a, 1995b). Rules are written down, records and accounts are audited. The key person in a *ciṭ* or *sosāiṭī* is the chairman/chairlady or agent. He or she assures that rules are observed and is ultimately liable for any losses. A team of a secretary or bookkeeper and a treasurer supports the chairman. Every member is obliged to bring a guarantor as soon as he or she receives money. All associations have strict and regular meeting schedules, standard contributions, and standard fines for non-payment. They are always held in the same place, on the same date, and at the same time. Meetings take place between the 7th and 12th of each month, because most of the people receive their salaries between the 6th and 10th.

During this time, one can observe group meetings in parks all over Delhi. Access to *ciṭs* and *sosāiṭis* is generally based on trust and personal relationships.

One major difference is the mode of operation. In a *ciṭ*, members contribute 500 IRs monthly to the creation of a fund, which is allocated at every meeting to at least one member of the group based on the tenders that are offered. In a *sosāiṭi* members contribute money (100 IRs) only once at the outset. From this amount members can take loans at interest rates of between 2 and 10%, and the volume of money of the *sosāiṭi* increases. As a result, members can borrow larger amounts of money and the value of their savings increases (Thieme 2003, 2005). In addition to the pattern of operation, another major difference is how the money is used in a *ciṭ* and a *sosāiṭi*. In *ciṭs* members have access to larger sums of money than in *sosāiṭis* and use their money solely for private purposes. In *sosāiṭis* members only have access to smaller sums during its lifetime, but at the end the money accumulated through interest is either distributed among the members for private use, or members invest it together in their village back home. However, experiences of migrants also reveal that violation of trust and defaulted payments can put the whole group of participants at risk and perpetuate their debt.

**Table 2:** Comparison between the main characteristics of *ciṭ* and *sosāiṭi*

	<i>Ciṭ</i>	<i>Sosāiṭi</i>
Type of association	Rotating Savings and Credit Association (RoSCA)	Accumulating Savings and Credit Association (ASCrA)
Meeting	Monthly	Monthly
Payment	Monthly	Once at the outset
Amount	500 IRs	100 to 250 IRs
Number of members	About 100	Varies from 30 to 100
Allocation of money	1. By auction/bidding 2. During the lifetime of one <i>ciṭ</i> each member gets money once	Joint decision by members whenever needed
Amount of money provided	Larger sums (between 20,000 and 80,000 IRs)	Mainly smaller sums (between 500 and 8,000 IRs)
Preconditions	Steady income of adequate size	No steady income required
Guarantor	Necessary	Necessary
Use of money	Private	1. Private 2. Community purpose
Interest	No interest (if the principle of balanced reciprocity applies) Money gain or loss depends on the bidding strategy of each member.	Simple interest (2 – 10% per month)

### Opportunities for participating in a savings and credit association

*Ciṭs* and *sosāiṭīs* provide services at source for the migrant in Delhi. They arise out of a member's initiative where commitment is basically very high. They can quickly mobilise contributions for sudden financial needs such as hospitalisation, burial or marriage (Table 3). Members have quicker access to larger amounts of money than would be possible by saving individually, and this especially applies to *ciṭs*. A *ciṭ* binds members to save regularly. *Ciṭs* and *sosāiṭīs* shorten saving times and provide peer information and supervision (Hospes 1998; Reinke 1998). Borrowers only have to find a guarantor, a process, which is solely based on trust (also Sika and Strasser 2001).

**Table 3:** Opportunities and risks for migrants participating in a *ciṭ* or *sosāiṭī*

<i>Ciṭ</i>	<i>Sosāiṭī</i>
<b>Opportunities</b>	
Access through patrilineal or kinship networks, village-based networks and friends	Access through patrilineal kinship networks and village-based networks
Steady income of adequate size	
<b>Benefits</b>	
Access to money (large sums between 16 and 40,000 IRs)	Access to money (Small sums, on average about 1,000 IRs)
Social occasion/purposes	Social occasion/purposes
<b>Use of money</b>	
Private investment (daily needs, buying a job, medical treatment, education, land, etc.)	Private investment (daily needs, buying a job, medical treatment, education, land, etc.) Community development (food depot, schools etc.)
<b>Risks</b>	
Dependency on continued participation	Dependency on continued participation
Fails if people cannot rely on each other (e.g., irregular contribution of money)	Fails if people cannot rely on each other
Order of rotation determined by auction	High interest rates between 2 and 10% per month
No balanced reciprocity in sharing funds	

*Ciṭs* and *sosāiṭīs* that run well strengthen the economic position of the migrants, or at least keep their situation stable. Whether or not savings will have a lasting impact on individual members depends on how money is used. *Ciṭs* and *sosāiṭīs* offer their members more than financial support. They are social events. Information on housing, boarding, employment opportunities, and transfer of remittances is disseminated. They provide migrants with stability and a means of integration between traditional and modern structures, between village and urban lifestyles. Bouman (1999) even sees rural to urban migration as a major benchmark in the rapid evolution of financial self-help associations. Members of *sosāiṭīs* often have a broader set of objectives than members

of *ciṭs*. Money saved in a *ciṭ* is used solely for individual purposes. Money saved in a *sosāiṭī* can be used not only for individual purposes but also for community development in migrants' villages of origin, as was confirmed for other migrants from *Bajhāng* in Bangalore (Pfaff-Czarnecka 1991). Whether money is invested in the home villages depends on how many people from a particular village are in Delhi, how well they get along with each other, and whether their *sosāiṭī* is running well or not. The extent to which migrants feel committed to contribute to the livelihood of the villagers back in Nepal is also important. Looking at other countries, Bouman (1999) stresses the moral obligation of every female and male migrant from Nigeria to contribute to financial self-help associations (*Gbe* or *Ajonú*) to improve village infrastructure.

Some villagers have more than one *sosāiṭī* due to intra-village conflicts, different investment interests, or simply because they live too far away from each other in Delhi. Migrants also exchange experiences. The lack of banking infrastructure – excluding banking customers' criteria and the migrants' lack of human capital, namely, the inability to read and write – prevents many migrants from using a bank. However, lack of banking infrastructure and human capital are not necessarily the only bottlenecks the target group faces in using a commercial bank. It must be noted that relatively well-off migrants also remain with *ciṭs* and *sosāiṭīs*, as well as the few migrants who do have a bank account. Other studies also confirmed that even businessmen rely on informal finance (also Seibel and Shrestha 1988; Hospes 1998; Seibel and Schrader 1999). Migrants stated that they do not trust banks. Even more important is that *ciṭs* and *sosāiṭīs* are a way of expressing trust and maintaining social capital between individuals. By participating in a financial self-help group, they create and maintain social bonds and respond to others' needs. There is no effective sanction against members who default, other than social isolation. Being accepted as a member of a *ciṭ* or *sosāiṭī* means that one is a trustworthy person, or that social capital is symbolically recognized (Summerfield 1995). This social and symbolic capital assures migrants of the maintenance of their social networks and access to future loans and keeps one's own standing and symbolic capital in a group.

### Risks of participating in a savings and credit association

Along with the positive aspects, migrants also had negative experiences with both forms of financial self-help associations. *Ciṭs* entail a greater risk of perpetuating debt and dependency than *sosāiṭīs*. The success of a *ciṭ* depends greatly on all members' continued participation. In a *ciṭ* each participant has a deep trust in the continuing contribution of others, even after they receive the pooled funds. Without such trust, no one would contribute and each member would be deprived of this effective means of gaining access to money (Geertz 1963; Light and Karageorgis 1994). The small size and homogenous structure of any *ciṭ* or *sosāiṭī* minimize the risks of loss. *Ciṭs* had about 100 members, while as *sosāiṭīs* were rather small, with 30 to 50 participants, not including the families of the members. Research findings by Nayar (1973), Coleman (1988) or Bouman (1999) show trends contrary to this finding in that accumulating associations like *sosāiṭīs* had up to several hundred members, and rotating associations

like *ciṭs* had small numbers between 12 and 50. Nayar (1973) describes the first stage in the evolution of *ciṭs* in the rural context:

“ ... well managed by an individual who knew even the family history of all residents in the area. The local people who participated in the transaction had, in turn, good faith in this individual foreman and every aspect of the chitty went on smoothly. Actually the question of surety for the prize amount did not arise because the financial position, honesty and character of the members were best known to the foreman.” (Nayar 1973: 117-118)

If people cannot build on their social capital, in the form of enforceable trust, the risk of a *ciṭ* collapsing before everybody receives his money increases, because of defaulted payments. Because payments in *ciṭs* are higher than in *sosāiṭīs*, the risk of losing a lot of money is greater for the chairman and the members. Migrants were aware of the danger of having too many members in associations. However, in *ciṭs* especially, they accepted this risk, as they would have access to more money contributed by more members (also Shipton 1992). Seibel and Shrestha (1988) also describe the fact that as the *dhukuṭi* is run by businessmen, people's bids were very low in the beginning. They needed money urgently for investment and expected high returns on their investments. When these expectations did not materialise, they found themselves unable to abide by their obligations. They dropped out of the *dhukuṭi* before its conclusion, to the disadvantage of the remaining members.

To run a *ciṭ* successfully, both strong leadership and peer-group pressure as an internal sanction mechanism are needed. The nomination of the chairman involves a lot of symbolic capital. Firstly, members have to be confident of a person's competence based on his reputation. Secondly, they have to trust in the ability of the chairman to wield power in the name of all other members in order to keep the *ciṭ* or *sosāiṭī* running (also Bourdieu 1983; Curran and Saguy 2001).

Scholars like Coleman (1988) and Bouman (1999), as well as all the migrants interviewed, emphasized bonding social capital or bonded solidarity and trust as preconditions for running a *ciṭ* or a *sosāiṭī*. However, the results suggest that this bonded solidarity is sometimes too limited to enforce peer group pressure and ensure that payments in default are collected (Evers 1994; Portes 1998). Many participants did not see any chance of enforcing payments. They were so closely related to each other that they did not want to harm their kin or friends. Depending on the chairman's leadership qualities, he faced the same dilemma. He had to decide between the economic rationale of a *ciṭ* or *sosāiṭī* in getting loans repaid or his moral obligation of solidarity to kin and friends. He could win or lose social esteem with both (Evers 1994). Knowing each other too well can have another disadvantage. If somebody knows that another member is in urgent need of money, members can make either a very high bid if they do not sympathise with someone, or a very low one if they favour a particular person. On the other hand, if members are satisfied with their *ciṭ* or *sosāiṭī*, they can build on common positive experiences and will trust each other (reciprocity transaction).

Another disadvantage of a *sosāiṭī* is the high monthly interest rate of 2 to 10%. Therefore, some people avoid them, preferring to borrow money from a private person who might charge less interest from someone they know. The high interest rates of a *sosāiṭī* cannot be described as usury, because the interest earned is returned to all members. Money is either distributed to all members or invested in the village.

In *ciṭ*, rates of interest are far more flexible and linked to the order of rotation. Rotation of the fund gives a *ciṭ* the character of gambling and is disadvantageous in some respects. All *ciṭs* observed do not operate according to the principle of balanced reciprocity. And not all participants draw from the fund as much as they put into it. Through the auction system, members themselves set the interest rate (percentage of capital loss). The longer a *ciṭ* runs and is successful, the more the amount collected increases along with possible gains, but the more the risk of default also increases. People who take the risk of waiting until the end of a *ciṭ* cycle receive their money having paid hardly any interest or, in the best case scenario, by receiving double the amount of money invested. In this case, the interest on the percentage of capital loss turns into a percentage of capital gain. Others pay 40% more money in than they receive in a *ciṭ*. The factors of luck and gambling are obvious.

A *ciṭ* cannot provide its members with one of the essential products offered by financial intermediaries, namely financial liquidity whenever needed. In a *ciṭ* it is difficult to predict when a member will receive funds. Even when it is received, the moment may be inappropriate. When money comes too early, the extended family may come begging for a share. If it comes too late, the members may lose the opportunity of a lifetime. Although the order is flexible, someone else's needs might be the greatest at a particular time. Therefore the advantage of a *sosāiṭī* is allocation of funds based on the needs of a member and not on an auction. While a *sosāiṭī* cannot provide such large amounts of money as a *ciṭ*, it is also less risky because the amount of money contributed as a one-time payment is lower than payments required to join a *ciṭ*.

Neither type of financial self-help group is able to cope with seasonal peaks, when, for example, all migrants go home during harvest festivities and need money in the same month. Therefore, some people participate in several *sosāiṭīs* or *ciṭs* or in both.

The rigidity of fixed monthly contributions in a *ciṭ* can be seen as positive in that members are forced to save. The negative side is that they need a very steady adequate income. The vast majority of people earn their money in the informal sector where income is irregular. If small excess income is not collected on the spot, it is consumed and fails to be converted into savings (Seibel and Shrestha 1988, Seibel and Schrader 1999). The system is also not flexible enough for migrants who want to go home for a short time. During this time they do not earn a salary and it is hard for them to provide payments to the *ciṭ*.

### 5.2.2 Work and life in Delhi

Migrants work mainly in the informal sector in Delhi. They are no exception to other people in India, considering that in 1991 90% of the Indian workforce worked in the informal sector (Kundu and Sharma 2001: 26; Sankaran 2001: 406). Kinship networks are again the major entry point. Extensive studies of the urban labour market have confirmed the role of personal networks in acquiring information about jobs in both the informal and formal sectors (Granovetter 1973; Reingold 1999; Mitra 2003). Migrants view their working conditions in an ambivalent light that reflects the negative aspects and opportunities in the informal sector in India. They work in low-skilled jobs, often holding more than one job; this was found to be characteristic of migrants elsewhere (Mitra 2003). Men combine jobs such as being watchmen and car cleaners at the same time. Women combine their non-paid household activities with paid housekeeping outside the home. Men and women do not receive any formal training. Because male migrants have been working as watchmen for generations, knowledge is even handed down from generation to generation. Although the informal sector does not provide any social security, migrants value its flexibility, as they can adapt their jobs to their way of migration and their way of life. If women are in Delhi, their husbands arrange a job for them. Migrants hand their jobs over to their closest relatives and friends and are paid for this, which shows that the informal sector is highly organized. The fact that men buy their jobs from their predecessors was also confirmed by another study of *Bajhāngis* in Bangalore (Pfaff-Czarnecka 2001). These job chains also provide migrants with the flexibility to go home whenever they need to, and with a certain security in terms of finding a job if someone arrives in Delhi. The custom of paying predecessors in a job has the positive side effect of migrants having at least some money when they return to Nepal. At the same time the 'job sale' makes them dependent on informal credit for seed capital. It puts the migrant in an even more vulnerable position, especially when a migrant loses his job right after buying it from a predecessor. For a job in the formal sector, in a security company for example, the majority of migrants would lack the required human capital such as a formal 10th grade school-leaving certificate.

The multi-job life is one reason why migrants prefer to work and live in the same vicinity, like urban immigrants around the world (Chan et al. 2000; Mitra 2003). Men establish their own households in Delhi, with multiple forms of cohabitation and overlapping social units. They share houses not only with their closest and extended family members but also with co-villagers from the same caste. Housing either takes up a large proportion of their low income, or migrants choose to live in cheap poor-quality housing – even on the pavement, in order to cut expenses and save every rupee possible for other needs (Satterthwaite 1997; Moser 1998; Dupont 2000; Mitra 2003). Additionally, their dreams and the perception that they are only temporarily living in Delhi, deprive them of the motivation to look for another job or to find a better place to live.

However, even if kinship networks are strong, life in the urban environment of Delhi offers a dramatic change, and the types of capital that people possess are valued differently, giving rise to constraints but also opportunities for migrants. In earning one's own money, a person can buy sufficient food, water, and electricity. In Delhi caste

hierarchies do not determine whether a low-caste person is allowed to use the water supply or not, or if his or her hamlet will receive electricity or not; and this is one reason why it is especially low-caste people who leave their villages. However, basic services in Delhi are expensive. Migrants therefore need a much higher income to survive and gain access to services such as water, food, health care, schools, and public transport. Limited financial capital prevents migrants from ensuring the best private medical treatment for family members or the best education for children in order to improve their human capital. At the same time, different forms of deprivation are not necessarily due to low income, but are also a result of the incapacity of public, private, or non-profit institutions in Delhi to ensure provision of services. Like many poor people in India, migrants are victims of excessive commercialisation of daily life in the form of bribery (Narayan 2000). Bribery adds to their daily expenditures and increases their social and economic exclusion, especially if they are unable to or do not want to give bribes. For example, a ration card is only issued after a person resides five years in one place. Without permanent residency, one has to know the right people to get such a card and also be willing to pay a bribe to have it issued. Not having a card prevents people from receiving discounts on food and the right to secure housing. Therefore, lack of financial capital, poor education, the illegal nature of their homes, and limited social networks constrain them. They cannot acquire assets that reduce their vulnerability, which is very characteristic of low-income people (Meikle 2002). In addition to all these difficulties, migrants are expected to send remittances to their families in Nepal or provide relatives coming to Delhi with money and help in finding jobs, shelter, or medical treatment. As a result of such great financial expectations, there is a certain lack of liquidity preference on the part of migrants in a social sense. If money is, for example, laid away in a savings and credit association, participants have a socially acceptable argument to refuse to give money to the family, clan, lineage, or neighbourhood (Hospes 1998).

### 5.3 Impact of migration on people's livelihoods

Outcomes of migration are multiple and contradictory. Distinctions can be made between migrants' own adverse experiences and the role that migration plays in reducing the vulnerability and poverty of the migrant's family in Nepal or even of a whole community (Ellis 2003).

Stark (1991) assumes an 'implicit contractual arrangement' between migrants and their families. She argues that a family finances the education of a migrant for a well-paid job abroad, and he or she has to send remittances in return. Family members often also invest in travel and recruiting expenses, so that one family member can go abroad and send remittances (Wyss 2004). In the present study, it is argued that the 'arrangement' looks rather different, and that it is not necessarily high financial investments and returns that count. The family, especially women, takes on a bigger workload in the villages to enable the men to go to Delhi. Women take on responsibility for the house and childcare and may even lose their decision-making power if they stay with their

parents-in-law. If the men do not come home for harvest, women also have to take on the added agricultural work, or must organise male support (Kaspar 2004; Thieme et al. forthcoming).

In return, the family expects migrants to improve their well-being and wealth. However, the potential of migrants to improve their own and their families' social and economic situations should not be overestimated. At the same time, although it exposes people to new risks, migration in the first instance reduces vulnerability. It contributes to a secure livelihood. It reduces the risks of seasonality, harvest failure, and food shortage. In rural communities with little cash income, even small transfers of cash can be highly valuable, e. g., in securing nutrition for the whole year. This was confirmed by Regmi and Tisdell (2002) in a study of internal rural to urban migration in Nepal. Emerging from poverty is a cumulative process, and assets are traded in sequence where remittances can play a pivotal role (Ellis 2003: 7). The most outstanding example is one *sosāitī* that reduces risk and vulnerability purposively for a whole community. The *sosāitī* reduces food shortages for a whole village by financing and managing a food depot and providing access to human capital, namely, education for people from several villages, by supporting a school. In addition, it provides individual investments in weddings, land, livestock, or education of children, and in this way supports people in increasing their well-being and wealth.

However, within this 'arrangement' are aspects other than financial returns, which reduce vulnerability. Every less person in the village reduces total food consumption – an important aspect in a region with a food deficit (see Pfaff-Czarnecka 2001; Raitelhuber 2001, Pkhakadze 2002). The density of networks between Delhi and Nepal makes migration less risky for individuals by circulating information among potential migrants and providing access to jobs. Family members can come to Delhi for medical treatment, and migrants cover their expenditure, as well as schooling for children, rather than sending money to Nepal. These contributions may look small, but they are still vital to the maintenance or even improvement of human capital, such as health and education and diversification of risk (de Haan and Rogaly 2002). These patterns of investment, and the fact that senders did not show much interest in revealing the full amounts involved to outsiders, make it difficult to calculate the exact amounts remitted. Additionally, the way in which remittances are spent shows the social embeddedness of migration. If men do not bring their families along, as the majority do, remittances, goods, and news are still a major factor in transnational linkages. Economic investments are also transformed into symbolic and social capital, and these are difficult to calculate. Next to family obligations it can be assumed that migrants also look after their own self-interests (Regmi and Tisdell 2002). Firstly, if migrants attend festivities, such as harvest festivals or weddings, they maintain their networks by doing so and the social capital between Delhi and home. Secondly, in supporting the family back home, they preserve good relations and prevent parents from selling their land if they want to inherit family property. Thirdly, financing feasts and bringing gifts of clothing, radios, recorders, etc. have an important symbolic value in increasing one's own honour and reputation as a successful migrant. The importance of gifts and costly feasts in main-

taining social networks is recognized in different cultures (Werbner 1990; Werner 1997). The assumption that migrants contribute a lot is more or less correct. Werbner (1990) gives an impressive picture of the importance of migration and remittances for the maintenance of social networks for British Pakistanis.

### The reproduction and challenge of social relations of inequality and exclusion

Migration contributes to a change in traditional relations between castes, gender, and generations. In Delhi, strong social ties with families and friends in Nepal remain even when people have been working in Delhi for decades. At the same time, traditional structures are transformed and merged with more progressive patterns, as is the case for migrants around the world (i.e. Narayan 2000; Amis 2001). Whereas traditional elders, males, and respective castes have leadership positions in the villages, among migrants people who were formerly excluded from power can also take the lead (Bouman 1999). Membership in *ciṭs* as in many *sosāiṭīs* provides examples of the melting and merging of traditional structures in terms of caste and gender at the same time. Caste rules are merged, in the sense that *ciṭ* members from all castes provide each other with the chance to have equal access to loans. Two *ciṭs* were even led by low-caste men. However, people knew each other from their home villages. Knowing each other for so long as family, clan, or caste members, or having patron-client relations, provides the 'credit-worthiness' and trust that are characteristic of social capital (Bourdieu 1983). Another reason for running *ciṭs* or *sosāiṭīs* together was that they live relatively close to each other in Delhi. At the same time, traditional caste relations remain to some extent. Despite the fact that one *ciṭ* is run jointly by all castes and provides equal access to loans for all, low caste members are (traditionally) not allowed to enter the rooms of high-caste members. In another *sosāiṭī* the majority of members are *Chetri*. On one occasion they decided to invest money in a temple back home, which cannot be used by the low castes or by members of the *sosāiṭī*.

*Ciṭs* and *sosāiṭīs* practise gender division in terms of membership. *Ciṭs* and *sosāiṭīs* are mainly run by men, and women are rarely seen. One reason is that the majority of migrants are male. Another reason is that many women come only for a limited period of time for medical treatment. They are not used to the urban environment and do not have much time to adapt, especially if they arrive in a bad state of health. However, the women who stay on longer find new dimensions in their lives and, in some cases, they start work as domestic workers. Recently, women from two villages borrowed the idea from their husbands and established their own *sosāiṭī*. Although women have contact with other women living in their colony, they use bonding social capital and follow traditional patrilinear and patrilocal family networks in recruiting women to their *sosāiṭī*. However, in using this bonding social capital and preserving this traditional pattern, they gain financial capital and new economic independence by earning their own money and managing it in their own *sosāiṭī*. They also gain by being able to afford better medical treatment and education for their children if they have children with them in Delhi (Thieme et al., forthcoming).

Another example of transformation of caste restrictions is that many migrants no longer pursue the caste-determined occupations for which migration is the major cause. This change is remarkable, since caste still determines a person's occupation in Nepal, as, for example, Molesworth (2001) pointed out in her case study of the Tamang in Central Nepal. Regarding caste and occupational determination, Bista (1999: 129) states:

“The majority of Nepalis do not have many job choices since occupation is determined by birth. For caste people this means an ascriptive determination of occupation, and for non-caste people a determination by other cultural and economic circumstances. In either case, people are not accustomed to thinking of a choice of profession but learn, from generation to generation, the same profession from elders within the family. Nepalis in general do not believe that they have to be trained in anything beyond what they see and learn while assisting senior members of their own family. In cases where this is reasonably profitable there is no stigma attached and they are happy with their work, guarding their family or caste-based professional skills jealously.”

Some *Damāi* kept their jobs as tailors, but the majority of male migrants worked as watchmen, which is not a traditional, caste-determined job. However, according to Bista (1999), the fact that many migrants remain in this job for generations suggests that they are not very interested in any other training. This rather pessimistic statement has some truth in it, but is also challenged by the results of the present study, looking at what people do even if they remain in their job for generations. Few people from the *Damāi* caste kept their ‘occupational pre-determination’ for tailoring. Their caste and occupational determination constrained them in their home villages and forced them to leave because of undesirable poverty and social discrimination. In Delhi they used this ‘job determination’ as an opportunity and developed it further, enabling them to run shops in a city where customers ask for the latest fashion trends. They therefore used a change in external factors through migration to change their entire life. Although remaining in the same occupational niche, other migrants also created their own lifestyles, contradicting the fatalistic approach of Bista (1999). One migrant used his high school education (human capital) and applied to a security company for a job. Other migrants, who were cheated while saving their money, learned from this experience and were supported by helpful employers so that they could open a bank account to keep their money safe or to save money for personal investments such as children's education. Women from high and low castes invested their savings from the *sosāiṭī* specifically in their children's education. The same men who accepted their fate as watchmen were innovative and organized one *sosāiṭī*. The transnational way in which the *sosāiṭī* is run enables migrants in Delhi, as well as non-migrating people in the home village, to gain access to loans. Additionally, running the food depot decreases the risk of food shortages for the whole village community and provides a job for one person as a full-time depot manager. This *sosāiṭī* demonstrates how migrants can bring innovations to their home villages, and it could be taken as a role model for other migrants and societies already in operation (Thieme 2003; Thieme and Müller-Böker 2004).

## Negative or limiting experiences of migration

Issues pertaining to working conditions in Delhi are reflected against the background of the positive impacts of migration. Working and living conditions and migrants' social status are poor. They are beset by harassment and bribes and lack redress for mistreatment by employers or public officials. Apart from the fact that jobs for migrants are no longer determined by caste, migrants still occupy a distinct niche in which men have been working as watchmen and car cleaners for generations and women as housekeepers. Therefore, the question that arises is why migrants interviewed in the case study have been working in the same jobs for generations. What prevents them from social mobility, an achievement that is often recorded for migrants whereby they gain skills and experience upward mobility in terms of job responsibilities and income (de Haan 1997; Wyss 2004; Thieme and Wyss 2005)? In discussing the reasons for the social practices of migrants, the interplay of habitus and social fields provides a useful theoretical framework.

Migrants in Delhi often mentioned that it was their fate (*bhāgya*) to work as watchmen, that they were offended by employers, or that colleagues defaulted on payments in a *ciṭ* or *sosāiṭi*. This attitude is very close to Bista's central idea in his book *Fatalism and Development*. He states that most Nepalese (essentially *Chetri* and *Bāhun*) are fatalistic, and this deprives them of the motivation to plan for the future. Happiness and success in life are the rewards of a previous life; this is known as karma. People are induced to accept powerful forces in the world. The only kind of action that can influence one's destiny is religious practice, and physical labour is thus despised (Bista 1999: 77-79). Karma denies any possibility of holding oneself responsible for one's status in society or condition in life.

This belief in one's karma is related to the little human and social capital possessed by migrants in Delhi. All migrants tend to accept occupational and wage discrimination because of their limited human and social capital. They have no protection against risks related to income, employment, and health. The majority of migrants felt stigmatised as 'rural and low-skilled Nepalis'. Many internalise this stigmatisation and do not feel capable of achieving higher social positions. They are afraid of losing their jobs, feel a lack of confidence because of their poor education, are unaware of their rights and opportunities, and hesitate to ask for external help or organise themselves. This social discrimination means that migrants stick to their jobs and their familiar but limited bonding social capital. They prefer to accept their situation and to earn regular though small amounts of money rather than try other things and risk losing everything they have.

The positive contradictory experiences of migrants show that customs can change through time and from one generation to another, and that migration can be a supportive vehicle for such change. However, these examples also reveal that it is difficult to generalise, and migration is not the only factor needed to change traditional structures. Personality and a sense of responsibility are important, be it for one's own life or as the leader of a group such as a savings and credit association.

Another reason for migrants' social immobility is their transnational migration patterns and oscillation between Far West Nepal and Delhi, combined with their perception of life. Pfaff (1995) even assumes in her case study of *Bajhāngis* in Bangalore that the drastic differences between urban and rural life paralyse migrants. Regardless of whether they migrate seasonally or spend the main part of the year in Delhi, the majority of migrants have families in Nepal. All of them live with the 'illusion of return,' dreaming of going back and never having to return to India. This has an important influence on how they invest or sustain their different kinds of capital.

Migrants rarely invest in housing in Delhi, but instead save their money for land in Nepal. Thinking that they will only be working in Delhi for a short time, they do not invest in human capital but choose the easiest means of getting a job through their social networks as watchmen and car cleaners. They live for years with the psychological burden of being separated from their wives and children in Nepal, although many of the men earn and stay long enough for their wives and children to move to Delhi and have access to education, basic infrastructure, and opportunities to earn income. In comparing rural and traditional lives in their home villages in Nepal with life in Delhi, the major impact of this "illusion of return" is that migrants must maintain their networks. They invest in their existing (bonding) social capital rather than extending it to bridging or linking social capital in which social ties, although looser, could help them to improve, for example, their job situation and also help them attain greater social and economic power. Many workers are not at all aware of existing supportive organisations such as the Nepalese embassy, immigrant associations, and NGOs, nor do they have much contact with people (Nepalese and Indians) who have other jobs or other social networks. On the one hand, strong reciprocal obligations and bonding social capital give migrants access to human and financial capital, in that people can migrate, get a job, and join a *ciṭ* or *sosāiṭi*. On the other hand, these strong reciprocal obligations make individual entrepreneurship difficult for them. Examples include the migrant who applied at a professional security company and aroused suspicion among his covillagers, or migrants with good incomes who are asked for loans by relatives. Other examples include savings and credit associations that collapsed due to too many defaulters among close kin and friends, or situations where relatives from Nepal expect their kin in Delhi to finance medical treatment and provide them with shelter and care, regardless of how much financial capital they actually possess at the time. Another challenge is that times of crisis and stress increase the vulnerability of the entire community that is bound by solidarity (Narayan 2000). For example, if the job market for watchmen declines, they have little or no chance of providing each other with support to find another job. Or, if a credit association collapses, every member is affected and could lose a substantial amount of money, putting his or her family members at risk of debt (also Moose et al. 2002).

These networks enable people to migrate but constrain them at the same time. When they want to return to their villages, the agricultural community's cooperation and patron-client dependencies, or social and symbolic capital, are essential for survival. Such capital is needed for ploughing, harvesting, or simply assuring access to food, espe-

cially in a region of food deficits. Being socially ostracized is tantamount to social death (also Bista 1999: 54). Therefore, if a migrant does not stay in Delhi, but wants to return once in a while, he must maintain these networks. It is risky to eliminate an existing circle of identity unless migrants have the option of entering a new circle, something the majority of migrants have neither in India nor in Nepal. This circle of identity and also dependency is what migrants referred to as *āphno mānche* (Bista 1999). It is not necessarily caste-based. Membership in one takes time, knowledge, and the right kind of support. Hence, if others are excluded it is not so much a matter of caste membership but of social exclusion in the absence of other qualifications. However, if lower caste members are included, there is still a long way to go before they are fully accepted, or before we can speak of equality (also Bista 1999).

This attitude changes somewhat if wives and children are in Delhi. They do not want to deprive their children of the possibility of growing up in an environment where caste does not determine their whole life and where they have access to education (human capital) and basic infrastructure. Hence women do not want to go back, so only their husbands go back from time to time. It will be interesting to see, therefore, how inter-generational migration linkages change if children come along, and which patterns of transnationalism the younger generation adheres to or invents.

It can be assumed that caste restrictions in the villages in Nepal also prevent common investments back home by people of different castes who work in Delhi. This would reveal to the home villages that caste rules are weakened. It would also require that the respective properties invested in such as temples, schools, water wells, etc. could be used together, which is often not the case. Some migrants who settled in Delhi with their families thought about or even tried to return to Far West Nepal. The ones who tried came back to Delhi again, because they felt paralysed by the traditional structures that cause social and economic marginality. Families who thought about going back were worried that their children would not have access to education.

These experiences also give us an indication of the heavy psychological burden migrants have to carry when they regularly return to their villages. At the same time, they want to go back from time to time in order to be able to cope with the fact that they live away from their families for most of the year. Added to this they have the stress of knowing that if they do not fulfil reciprocal obligations support networks might erode.

Alcohol plays an important role in the daily life of migrants in terms of gaining social acceptance. Migrants mentioned that not consuming alcohol excludes them from the group (also Pfaff-Czarnecka 1996). Based on statements of both female and male migrants, consumption of too much alcohol also prevents migrants from saving money. Alcohol abuse is quite common among migrants, although an in-depth research survey on consumption patterns provides greater insight. Extensive alcohol consumption has already been recorded for Far West Nepal. In Delhi alcohol is also frequently used to manage and alleviate stress. Often, combined with other male leisure activities, alcohol places an added financial burden on the whole family, no matter whether they are in Delhi or in Nepal. Alcohol abuse puts a tremendous strain on the emotional well-being

of a family, and, in the author's view, on the entire circle of close relatives and friends. The decline in social cohesion within the community affects not only friends and neighbours, but also kinship networks and traditional hospitality (also Narayan 2000). On the other hand alcohol is consumed for pleasure. Next to socialising, it has an integrating component, as was recorded for slum dwellers in Bangkok (Pronk 1995). It indirectly secures access to information about jobs and it helps to build up trust to participate in a *ciṭ* or *sosāiṭī*.

The daily lives of migrants do not indicate that they are among the poorest of the poor who struggle for daily survival to stay above the poverty line. However, all of them are vulnerable and seem to live what Ellis (2003) calls 'on the edge'. It is only a small step between the ability to survive and thrive and sudden loss of the ability to do so. Savings and credit associations are struggling or have collapsed due to a lack of reliability among fellow members, or because migrants lost their jobs and were no longer able to pay. Debt is a tool or panacea for managing livelihoods, and credit associations are frequently used as a source of loans. Because of long-term debt, migrant labour is often unproductive and unprofitable for those who migrate, ensuring that they remain migrants for their entire lives. Women and all relatives who remain in the villages, and also those in Delhi, are trapped in this cycle, by their family and kinship structures and by related moral and financial obligations.

The experiences of migrants reveal the importance of their kinship networks. They show that the extent of an individual's social capital depends firstly on the extent of social relationships, and secondly on the amount and quality of the capital of those with whom the migrant is in contact. Both contacts are very limited and concentrated on closest family, kin, and caste relations, which can be categorised as 'bonding social capital'. Use of this bonding social capital changes power relations to a certain extent among groups of migrants, i.e. within their 'bonding social capital' or 'strong ties'. However, what the majority lack is 'bridging social capital' which could bring about changes in power relations as a group. Another investment problem in the villages is the risk of transferring money by hand. In addition to thievery, migrants also have to cope with arbitrary border controls because of the political situation, which has resulted in widespread bribes being exacted in order to cross the border without problems.

Although not part of the present study, vulnerability to HIV AIDS and other sexually transmitted infections can be assumed among migrants and their families. Recently, studies on HIV prevention, care, and support have been carried out in *Bajhāng* and the neighbouring district *Doṭī* (<http://www.carenepal.org>, 19/10/2004). The study in five villages in *Doṭī* District revealed that among 137 men (migrants and non-migrants), 8% were positive for HIV infection and 22% for syphilis (Poudel et al. 2003). A study in *Ḍaḍeldhurā* District (Far Western Development Region) gave similar indications (Pkhakadze 2002).

Development also requires stability and security, which migrants do not have in their undocumented and informal positions. Furthermore, the political situation in Nepal provides little hope of short-or mid-term changes regarding political and economic stability.

One prevalent paradox is that it is always assumed that people migrate to India and not to high-income countries, especially because of a lack of financial capital. The present study suggests that lack of social capital is even more important than financial capital. Migrants in India also need seed capital, not only for travelling but to buy jobs. In addition, it was shown that migrants could raise large amounts of money, especially from *cits*. Maybe not every migrant could have gone to another country. However, since people can raise large amounts of money, they could use this money to migrate somewhere else, using Delhi as a transit point en route to another country. A major reason why they do not migrate to other countries is that they do not have information about other migration possibilities and procedures. Also, they do not know anybody who has been to another country, and they feel comfortable in following their family and kin to a place they know, as the majority of migrants worldwide would do. This observation emphasises once again that migration is not determined by financial capital only but also by social and human capital.

## 6 Conclusion, Outlook and Practical Implications

### 6.1 Conclusion

Labour migration is a major livelihood strategy for many people in Nepal. This also applies to the people of *Bajhāng* and *Bājurā* from Far West Nepal. The focus of the present study was to explore the daily life of migrants and to see what individual or structural background enables them and their families to profit from migration and what prevents them from doing so. This question cannot be answered generally. It must be approached through case studies, because migration patterns and experiences vary widely.

In the present case study, the social and economic conditions and practices of migrants from *Bajhāng* and *Bājurā* in Delhi, their destination, were analysed.

Far West Nepal is a marginalized area of Nepal with the lowest Human Development and Gender Equity Indices in the country. Impoverishment, indebtedness, social discrimination, and lack of infrastructure in *Bajhāng* and *Bājurā* have been the cause of large-scale labour migration to India for generations. Usually men seek work in Delhi, leaving behind the extended family. Sometimes they take their wives and children later on. Women come from time to time for medical treatment, especially pre- and postnatal care.

Male and female migrants in Delhi generally possess little human and financial capital, which limits their access to jobs, shelter, and physical infrastructure. At the same time, they are endowed with strong bonding social capital. They rely on these social networks to become established in Delhi, to find a job and shelter, and to organise access to savings and loan options and remittance transfers. Family and kinship networks are the most important coping mechanisms. When they are insufficient, assistance is sought from caste networks or from trustworthy persons beyond the caste. However this bonding social capital, on which migrants rely, compensates their lack of other capital only to a certain extent, and it provides only limited access to human, financial, and symbolic capital. Also, the social networks among migrants are not the same for everyone.

The job market for unskilled migrants is highly gender segregated, and they occupy a distinct niche. Few *Damāi* kept their jobs as tailors. However, the majority of men, regardless of caste, work as watchmen and car cleaners. If women are in Delhi for longer periods, they engage in housekeeping. The job market is highly organized since jobs are handed over and sold within networks. Men need substantial seed capital to pay their predecessors for jobs. This fact disproves the popular belief that people who migrate from Nepal to India do not need financial capital apart from travel expenses, unlike the Nepalese who migrate through recruiting agencies to the Gulf States or Malaysia.

To gain access to this seed capital and general loans, migrants have two kinds of financial self-help associations, *ciṭs* and *sosāiṭis*. The primary purpose of both is saving and lending money. Private money-lending is very rare and commercial banking is not used, with very few exceptions. *Ciṭs* are rotating savings and credit associations, in that the monthly pooled fund is immediately given to one of the members. *Sosāiṭis* are accumulating savings and credit associations in that members collect money only once at the outset. Later on, they take out loans from the fund at interest, and this helps to accumulate more money. *ciṭs* and *sosāiṭis* promote motivation and discipline among savers. Migrants use them for their convenience and familiarity and to maintain social relations. This demonstrates that marginalised people may not have access to credit through formal banks, but can have considerable savings capability by mobilising social capital. The influence and the achievements of these associations go far beyond the frontiers of the financial landscape. They provide social security and stability in the urban environment and possibilities for community development.

One main difference between *ciṭs* and *sosāiṭis* is how the money is used. In *ciṭs* the main flow of money is directed to private consumption, durable consumer goods, payment of school fees, ensuring survival, and improving the quality of life. Money from *sosāiṭis* is often used for collective investments in home villages such as school buildings, temple reconstruction, and financing food depots. When migrants provide each other with access to loan and savings options, dependency and exposure to risks occur at the same time. *Ciṭs* present more risks than *sosāiṭis*. Risks present in *ciṭs* include the lack of instant access to credit. This implies that the migrant does not necessarily receive the money when he/she needs it most urgently for an investment. Other risks are of a speculative nature and include the moral hazard of bidding. Both *ciṭs* and *sosāiṭis* have a drop-out risk with early recipients of the fund. Access to both is based solely on trust, but peer group pressure to ensure repayment is very limited. The informal method of organisation means that groups are beyond the protection of the law.

Although it brings exposure to new risks, migration reduces the vulnerability of family members who remain at home. First of all, it improves food security. In addition, migrants provide substantial sums for life cycle events such as weddings and funerals. Of the equal importance is the fact that migrants provide the entry point for medical treatment and schooling for children. If women migrate and stay for a long time, men are a source of both financial and social capital. Women follow the traditional patrilineal and patrilocal family networks through which normative expectations, such as kinship obligations, are reinforced. However, in keeping these patterns, they gain a new economic independence by earning their own money and managing their own *sosāiṭi*.

Migration linkages between the villages and Delhi are inter-generational and reproduce social structures. At the same time, traditional structures are transformed and merged with modern patterns. Whereas traditional elders, men, and the respective castes they belong to have leadership in the villages, people who were previously excluded from power can also take the lead. Mixed membership in *ciṭs* and *sosāiṭis*, or working in the same job regardless of caste, are examples. Nevertheless, the case study also showed

that changes in social structures take a long time and do not apply to everyone in the same way. Personality and sense of responsibility are important, be it for one's own life or as the leader of a group.

Although migrants are not the poorest of the poor who have to struggle for daily survival, all of them are vulnerable and seem to live 'on the edge'. There is only a small step between ability to survive and thrive and sudden loss of the ability to do so. For the majority of migrants, power relations change to a certain extent within their group. What the majority lacks is bridging social capital as well as human and financial capital to change power relations as a group. Through their work as watchmen and their existing financial self-help groups in Delhi, migrants have managed to find an economic and social niche. As the majority do not acquire new skills or attitudes, it seems that their marginality is once more made manifest. Migrants deal daily with poor working and living conditions, bribes, and lack of redress to mistreatment by employers. Their poor education, undocumented status, informal work, and lack of 'bridging' social capital contribute to these circumstances. Strong reciprocal obligations make them successful in times of crisis, but they render individual entrepreneurship difficult. Times of crisis and stress increase the vulnerability of the entire community.

Individual migrants participate in *ciṭs* or *sosāiṭis* or in both. Debt is a tool for managing livelihoods. Migrants borrow from one source to repay another. They find themselves tied into an expanding network of credit dependency, with their whole family and even kin in Nepal trapped in this cycle. Because of its linkage to long-term debt, migrant labour in India is often unproductive and unprofitable for those involved. The rigidity of high, fixed monthly contributions to a *ciṭ* also keeps migrants in Delhi, because they could never earn the money to repay their debts in Nepal. Most migrants have families back home. Even if they migrate seasonally, or stay most of the year in Delhi, all migrants dream of going back to Nepal forever. Since migration substantially improves standards of living for a small number of people only, migration and life in Nepal and India are rather routine. Migration structures the everyday practices of migrants and the people who remain in Nepal, their social positions, and employment trajectories. The absence of certain types of social capital and poor human capital and knowledge about other places limit the extent to which migration is an option. Thus, even if migrants succeed in keeping their families above the poverty line, they do it at considerable social cost – or at the cost of depleting other assets.

Since the socio-economic and political situation in Nepal does not seem likely to change in the near future, migration will remain a livelihood strategy. Therefore, the decisive development issue seems not to be how to reduce migration, but how to reduce its social and economic costs and increase its returns.

## 6.2 Practical implications

### General recommendations

- It is important to consider social relations of power within family and kinship structures and rights in Nepal as well as in India. These structures affect people's access to key resources such as land, labour, and financial and social capital. Programmes on migration issues should focus on a holistic and integrated approach through which people gain knowledge and information and hence power.
- The outline of the existence of transnational migration networks and transnational social spaces has shown that the lives of migrants and their families back home are deeply interwoven. Therefore projects or programmes on migration should address the point of origin and the point of destination, or even people at other localities involved.
- Statistics about migration from Nepal to India should be more accurate.
- Policy measures should be taken to influence the use of remittances, as is the case in other Asian countries such as Sri Lanka, Pakistan, and Thailand (Athukorala 1992). Here governments provide incentives for migrants to send remittances. They provide support in business counselling and training and allowances to import machinery and equipment with low customs rates.
- The contribution of migration research to policy-making should be enhanced. Further research has to be carried out and communicated. Policy-makers, international donors, and NGOs, e.g. immigrant associations, should be informed about research results, as they are sometimes not aware of certain problems or simply lack the capacity to do in-depth research. By communicating results, researchers could support these organizations in networking with others.

### Education, skills, access to labour and advocacy

- Lack of education is a problem and efforts to improve literacy, especially, need to target both women and men.
- To increase economic profit and power, it is crucial to consider the importance of economic literacy concerning income, savings, lending and borrowing of money, banking, and sending and investing of remittances, as well as related gender issues. For remittances, investment role models such as successful and innovative financial self-help groups could be promoted. If migrants acquire economic literacy, they should be encouraged to use and pass on the knowledge they have gained to others in Delhi as well people back home in Nepal.
- In cases where migrants have to pay a large sum of money to receive a job from a predecessor, or have to take a loan to cover travel costs, labour opportunities and wage-earning capacities need to be gradually separated from debt, advanced sale of labour, and high interest repayments.
- Conditions of employment should be improved through arrangements for health, education, skills training, social security, and enhanced bargaining power.
- Laws and policies already agreed upon (e.g. human rights, Nepal-India Treaty) should be implemented more strictly to improve migration policy. Migrants face a lack of support from both sides; neither India nor Nepal feels responsible for their problems.

- Contacts with existing organizations, such as the Nepalese immigrant associations, NGOs, and Trade Unions should be strengthened to enhance the bargaining power of migrants. They can provide legal awareness about labour legislation and rights through training programmes.
- Skills training should be provided to Nepalese migrant workers, and they should be provided with adequate conditions in which they can find better jobs as well.
- If migrants do not engage in collective action to voice their interests, they will probably face more discrimination in their destination country. Hence they need to form associations to acquire a political voice.

### **Commercial banking**

- The lack of formal banking systems is an obstacle in remittance to and investment of money in Far West Nepal, although this is changing. Access to banks should be facilitated for migrants. Banks should see migrants and their families as a potential customer group. They could consider developing specific remittance and savings products for this target group.
- Evaluation of the banking system in Nepal and India should be carried out, to show whether NGOs have access to banks and whether they could therefore build links among the villages where out-migration occurs to ease remittance transfers.

### **How can Savings and Credit Associations better contribute to migrants' remittance strategies?**

- By recognizing that informal systems of savings and credit associations work, despite the weaknesses detected, and that they do have positive aspects that should not be ignored. Self-help associations have their own ways of helping their members and their own rules.
- By informing potential members of the advantages and disadvantages of savings and credit associations
- By overcoming the rigidity of fixed, high monthly contributions to introduce flexible savings, withdrawals, and repayments (Seibel and Schrader 1999)
- By upgrading and mainstreaming these associations through networking among informal savings and credit associations
- By offering assistance to establish a network and enlist members. The network could then be registered as an association, foundation, etc.
- By keeping management and decision-making in the hands of the poor.
- By giving members freedom to choose whether they remain informal network members or seek semi-formal or formal status and ownership, considering the fact that permanent organizations have a penchant for increased formalisation and bureaucracy.
- By enhancing management skills and operational practices within the network and offering training in bookkeeping, legal assistance, auditing, and commercial banking.
- Because *cits* have no permanent fund, linking them with banks seems impossible. *Sosāiṭis* have a permanent fund, so they could be linked to a bank. This would offer advantages in terms of additional interest earnings, security, and possibly access to

other financial services, including money transfer services (Seibel and Shrestha 1988; Seibel and Schrader 1999; Seibel 2000; Aliber 2002; Thieme 2003).

**Experience in implementing research results**

- One aim of the programme is the implementation of research findings in cooperation with researchers and local policy-makers or NGOs. One project is running in Delhi. Through advocacy and training courses, it successfully addresses critical issues among the migrants described – lack of (economic) literacy, lack of knowledge about migrant workers' rights and bargaining power, and awareness about critical health issues such as alcohol abuse and sexually transmitted diseases such as HIV/AIDS. Another project running in Nepal as part of the NCCR North-South programme addresses the lack of information about labour rights and other migration options. Since 2004, information about jobs, recruiting agencies, and general advice for migrants have been communicated by a weekly radio programme called Paurakhi (Thieme et al. 2005).

## Appendix: Nepali–English Glossary

Nepali terms are transliterated according to Turner (1990). Names of places are according to maps at scales of 1:25,000 and 1:50,000.

Nepali terms and places	Explanation
<i>Achām</i>	District of Nepal
<i>āphno mānche</i>	Close circle of kin and friends
<i>Bāhun</i>	Caste in Nepal
<i>Bajhāng</i>	District of Nepal
<i>Bājurā</i>	District of Nepal
<i>bhāgya</i>	Fate
<i>Brāhman</i>	Caste in Nepal
<i>Candāro</i>	Caste in Nepal
<i>Chetri</i>	Caste in Nepal
<i>ciṭṭhī</i>	Letter (migrants also used this term for chit/cit, their financial self–help group)
<i>ciṭṭhā</i>	Lottery (migrants also used this term for chit/cit, their financial self–help group)
<i>ciṭ</i>	Financial self–help group
<i>ciṭṭhā</i>	Lottery
<i>Damāi</i>	Caste in Nepal
<i>Ḍaḍeldhurā</i>	District of Nepal
<i>ḍhukuṭi</i>	Rotating credit association
<i>Ḍholī</i>	Caste in Nepal
<i>Ḍoṭī</i>	District name
<i>ghar</i>	House, household, husband’s home
<i>Gothpādā</i>	Village in Nepal
<i>jāt</i>	Caste, subcaste, kind
<i>Jhosi</i>	Caste in Nepal
<i>Kādā</i>	Village and VDC in Nepal
<i>Khaptaāḍ</i>	National Park in Far Western Development Region
<i>Kāṭhmāṇḍu</i>	Capital of Nepal
<i>Khaḍkā</i>	Caste in Nepal
<i>Luhār</i>	Caste in Nepal
<i>Mājhiḡāū</i>	Village and VDC in Nepal
<i>māitī</i>	Married women’s paternal home
<i>Meltaḍī</i>	Village in Nepal
<i>Pādhyāya</i>	Caste in Nepal

<i>Paudel</i> or <i>Paudyāl</i>	Caste in Nepal
<i>Rāwal</i>	Caste in Nepal
<i>Rokāyā</i>	Caste in Nepal
<i>Sārki</i>	Caste in Nepal
<i>Serāgāū</i>	Village in Nepal
<i>Śhreṣṭa</i>	Caste in Nepal
<i>Singrā</i>	Village in Nepal
<i>sosāiṭī</i>	Name for financial self-help group
<i>Sunār</i>	Caste in Nepal
<i>Terāi</i>	Lowland of Nepal
<i>Thakurī</i>	Caste in Nepal
<i>Thākāli</i>	Caste in Nepal
<i>Thāpā</i>	Caste in Nepal
<i>thar</i>	Family or clan lineage
<i>Upādhyāya</i>	Caste in Nepal
<i>Urāy (Udās)</i>	Caste in Nepal

## Acknowledgements

This paper presents a summary of activities carried out during research for a PhD thesis at the Department of Geography, University of Zurich (Thieme 2006). Many people have contributed to this study in different ways. I would like to thank Prof. Dr. Ulrike Müller-Böker and Dr. Michael Kollmair, Development Study Group at the Department of Geography, University of Zurich, Switzerland, for their supervision, steady support and advice. Apart from the University of Zurich, I would like to gratefully acknowledge the financial support of the Swiss National Science Foundation and the Swiss Agency for Development and Cooperation, within the framework of the NCCR North-South programme.

In Nepal, my special thanks goes to Ganesh Gurung and Usha Gurung (NIDS) and Prof. Bhim Subedi (Geography, TU Kathmandu), and Siddhi Manandhar (RCO JACS South Asia office).

In Delhi, I am deeply indebted to my research assistant and interpreter Deepak Prakash Bhatt. I also thank his family for their kindness throughout my time in Delhi. I am infinitely grateful to people from Far West Nepal for their patience and openness in answering my questions and introducing me to their daily lives in Delhi. I thank Raju Bhattra and the whole team of the South Asia Study Center (SASC) for cooperation in implementing a project addressing migrants' needs in Delhi within the framework of NCCR North-South programme. I thank Ashutosh Saxena and Himani Sethi of the South Asia Research and Development Initiative (SARDI), Dr. Veronique Dupont, Director of the Centre de Sciences Humaines in New Delhi, Dr. Nandini Sundar (Jawaharlal Nehru University), ILO, UNDP, and V.V. Giri, National Labour Institute in Delhi, for practical support.

I would like to thank Prof. Dr. Isabelle Milbert (IUED Geneva), Prof. Dr. Hans El-sasser (Department of Geography, University of Zurich), Dr. Tovi Fenster (Tel Aviv University), Dr. Elisabeth Bühler and PD Dr. Norman Backhaus (Department of Geography, University of Zurich), Simone Wyss, Heidi Kaspar, Irene Rohner and the Human Geography Division, University of Zurich, for inputs and shared work experience.

I thank Martin Steinmann, Marc Zaugg, Greta Rana, and Andrew Peaston for technical support. I gratefully acknowledge discussions, collegial support and general encouragements by Birgit Kopainsky, Mai Lin Tjoa-Bonatz, Christine Müller, Olivier Ejderyan, Urs Müller, Pascale Herzig, Charis Keller-Lengen, Kate Molesworth, Marc Zaugg, Ghana Gurung, Susanne Herppich, Susanne Hanson, Sabine Timpf, and all the members of the Swiss NCCR PhD network and the Geo Vip group.

Last but not least, I would like to thank Peter Fuchs, my mother, brother and grandmother for their unfailing understanding and help, and Simone Olbrich, Anja Reischke and Jörg Beier for encouraging me to go to Zurich.

## About the Author

Susan Thieme received a PhD in Geography from the University of Zurich. Her doctoral research focused on labour migration from Nepal to India and selected aspects of migrants' daily lives, such as working and living conditions, management of loans and savings, and remittance transfers. Since 2006 she has been leading a research project on multilocal livelihoods with research sites in Central Asia, South Asia, and Central America. This project is part of the National Centre of Competence in Research North-South (NCCR North-South).

Website S. Thieme (and also link to the project): <http://www.geo.unizh.ch/~suthieme/>

Thematic research interests: Migration, livelihoods, theories of migration and social change  
Geographic expertise: India, Nepal, Kyrgyzstan

In Far West Nepal – an area extremely impoverished even by Nepalese standards – labour migration to India has been an integral part of the livelihood strategies of the majority of the people for several generations. This paper is based on case studies among male and female migrants in Delhi who came from four villages in Far West Nepal. The analysis focused on selected aspects of the migrants' daily lives, such as working and living conditions, management of loans and savings, and remittance transfers. It was found that the whole migration process is mainly facilitated by transnational kin and friendship networks. To grasp the geographical and social dimensions of the migrant's lives, an integrative approach was combined with the sustainable livelihoods approach, Bourdieu's theory of practice and his concept of social capital, with a view to contribute to developing the concept of transnational migration.

The results show in addition that the majority of the migrants were male. The unskilled migrants occupy a distinct niche in which men have been working as watchmen and car cleaners for generations. The job market is highly organized, as jobs are handed over and sold within networks. If wives of migrants are in Delhi for longer periods, they engage in housekeeping. To meet their financial needs, migrants established their own informal savings and credit associations. Although migration is primarily seen as an opportunity by the migrants, it can also perpetuate debt and dependency, meaning that people remain migrants for their entire lives.

The NCCR North–South Dialogue Series presents reflections on research topics of concern to programme members throughout the world.
